**PRESERVATION AND ENHANCEMENT OF THE AMERICAN FALLS AT NIAGARA.**
American Falls International Board, Buffalo, N.Y.
Final Report to the International Joint Commission, June 1974. 154 p, 44 plate, 1 map, 9 tab, 1 append.

Descriptors: *History, *Rivers and Harbors Act, *Waterfalls, *International Joint Commission, *Talus, Rivers, Harbors, Scenery, International waters, Natural use, Erosion, Erosion control, International commissions.
Identifiers: Evidence.

Section 304 of the Rivers and Harbors Act deals with the American Falls at Niagara as a scenic spectacle of international significance and with the continuing process of change in the form and appearance of the Falls. The study concludes that the guiding policy should accept the process of change as a dynamic part of the natural condition of the Falls, and that the process of erosion and recession should not be interrupted. The American Falls International Board reported the following findings and conclusions to the International Joint Commission: that it is feasible to remove as much talus as desirable; that the appearance of the Falls cannot be studied in isolation; that the area is endangered by the possibility of erosion and other geological conditions; and that measures are both feasible and desirable to protect these areas in order to eliminate any hazards to persons or property or to the scenic beauty of the region. Rhode Island Univ., Kingston.
L. M. Alexander.
Ocean Development and International Law, Vol 2, p 151-185 (1974). 35 p, 2 tab, 1 map, 1 append.

Descriptors: *Geographical regions, *Shores, *Regions, Regulation, Gulfs, Water, Sea water, Conferences, South America, *International law, International waters.
Identifiers: International agreements, Coastal waters.

One of the possible outcomes of the Third Law of the Sea Conference may be a recognition of the right of countries within a geographical region to establish special juridical arrangements for their offshore areas. Regions may be of two types: common policy groupings, such as the Latin American or Soviet Union/East European Socialist states blocs; or complementary-use regions, as the Carribbean, Mediterranean, or other semi-enclosed seas. The authors postulate that serious attention should be given at the conference both to the definition of regions as geographic entities and to the delineation of the types of special rules and regulations which may be adopted within these regions. A summary of the geographic and legal/political characteristics of twenty-five 'semi-enclosed seas' are presented as illustrative of a clearly defined type of complimentary-use region for which specific jurisidictional arrangements might be made. Identifiers: *Civil law rule, Common enemy rule.

Because of increasing population growth and the concentration of people in urban areas, the

disposition of surface water has attained greater significance in the context of modern land development. The legal implications of the problem are considered, with particular focus on the application of the civil law rule of surface water in both its strictly applied and modified forms. Disturbance of the natural flow of water is prohibited under this doctrine, thus the duties of adjacent landowners are reciprocal and complementary. The rationale of the rule and various modifications of the rule in actual application by courts are discussed. Various bases for liability are surveyed in the context of remedies for the damaged plaintiff and possible defenses for the alleged wrongdoer. The authors dispute the contention that the civil law rule has inhibited land development, and conclude that the modifications of the civil law rule adequately balance conflicting interests and offer substantial predictability. Man's interference with the rich and varied California coastline has resulted in beach erosion, pollution of bays and the ocean, and disruption and deterioration of the lagoon and estuarine environments. Environmental concern in the state has focused substantially on the area's coastal resources. This article considers the legal aspects of governmental involvement in preserving the coastal zone. Powers and constraints on power are discussed in the context of the 'public trust doctrine'. The authors suggest that the doctrine provides a legal tool for improving and preserving the natural environment. Generally, the public trust doctrine is based on the principle that the state holds title to tidelands and navigable waters subject to a trust with the public as beneficiary. Placing primary emphasis on California law, the paper traces the development of the doctrine and discusses the powers and duties of decision-makers who handle public trust land. (Fernandez-Florida)

**RULES AND REGULATIONS, SOUTHWEST WATER MANAGEMENT DISTRICT (FLORIDA).**
Southwest Florida Water Management District, Brooksville.
Florida Administrative Code, 16 G-4.004 thru 16 G-4.463 (1974). 122 p.

Descriptors: *Permits, *Water policy, *Administrative agencies, *Water management(Applied), *Florida, Local governments, State governments, Groundwater, Groundwater recharge, Surface waters, Water resources, Water shortage, Water supply, Water table, Aquifers, Water wells, Water law, Water levels.
Identifiers: *Florida Water Resources Act of 1972, State policy.

The purpose of the Rules and Regulations of the Southwest Florida Water Management District is to implement the declared water policy of the District and the State of Florida by effecting maximum beneficial utilization, development, and conservation of the water resources of the District. The Rules consist of five chapters, the first of which, 16CB-0, contains the purpose of the Rules, procedures for acquiring permit application, fee schedules, and provisions for the determination of minimum flows and levels. Chapter 16CB-1 contains rules for the protection of the works in the District, which is to be accomplished by requiring permits for those who find it necessary to interfere in any manner with any of the works of the District. Chapter 16CB-2 contains a program for the issuance of permits authorizing the consumptive use of water. Chapter 16CB-3 concerns the regulation of wells and the registration of any person who constructs a water well or test or foundation hold within District boundaries. Chapter 16CB-4 governs the management and storage of surface waters. Permits are required to construct, alter, abandon or remove any dam, reservoir, or impoundment. (Denvir-Florida)

**RULES OF CENTRAL AND SOUTHERN FLOOD CONTROL DISTRICT, CHAPTER 16CA, WITH COMMENTARY.**
Central and Southern Florida Flood Control District, West Palm Beach.
Florida Administrative Code, 16CA-0.01 thru 16CA-4.14 (1974). 16 p.

Descriptors: *Permits, *Water policy, *Administrative agencies, *Water management(Applied), Florida, Local governments, State governments, Groundwater, Groundwater recharge, Surface waters, Water resources, Water shortage, Water supply, Water table aquifers, Water wells, Water law, Water levels.
Identifiers: *Florida Water Resources Act of 1972, State policy.

The Rules of Central and Southern Florida Flood Control District were promulgated to effectuate its powers, duties and functions under the Florida Water Resources Act of 1972. The purpose of the regulations is to effect the maximum utilization of the waters in the District. The Rules consist of four chapters. Chapter 16CA-0 contains the scope of jurisdiction and powers and duties of the district. In addition, Chapter 16CA-0.06 sets forth activities for which permits must be sought, such as the diversion of water, construction, alteration, or abandonment of any dam or reservoir in the District, as well as any discharge into the waters of the District. Chapter 16CA-1 prescribes the procedures for filing of citizen complaints or objections, administrative enforcement procedures, quasi-judicial hearings before the governing board, and requests for hearings. Chapter 16CA-2 provides for the implementation of a permit system designed to regulate and control the use of ground and surface water within the District. Chapter 16CA-4 deals with the management and storage of surface waters in the District and the works necessary to those ends. (Denvir-Florida)

**HARDY SALT CO. V. SOUTHERN PACIFIC TRANSPORTATION CO. (SUIT SEEKING INJUNCTIVE RELIEF OR DAMAGES FOR SALINITY CHANGES RESULTING FROM DEFENDANT'S CONSTRUCTION IN THE GREAT SALT LAKE).**
501 F.2d 1156 (10th Cir. 1974). 14 p.

Descriptors: *Salinity, *Railroads, *Great Salt Lake, Royalties, Wastes, Navigation, *Utah, Easements, Salts, Brines, Shrimp, Rivers, Harbors, Rivers and Harbors Act.
Identifiers: Evidence, Injunctive relief, Nuisance(Legal aspects).

Plaintiffs brought consolidated actions seeking injunctive relief or damages for alleged injury from salinity changes resulting from defendant railroad's construction and operation of a causeway across the Great Salt Lake pursuant to an easement granted by the State of Utah. The United States District Court for Utah, Central Division, sustained the railroad's motion to dismiss, prompting plaintiffs' appeal. The Court of Appeals affirmed and held the plaintiffs, engaged in removing salt or brine shrimp and eggs from Great Salt Lake pursuant to royalty and license agreements with the State of Utah, failed to demonstrate the type of a business or economic interest entitling them to relief under state law for nuisance, waste or interference with business. The court further held that proof of navigation across the lake and up the Bear River to the railhead at Corinne, Utah, was not in itself sufficient to establish that the lake was a navigable water of the United States within the Rivers and Harbors Act. **SMITH V. CITY OF COOKEVILLE (ACTION BY LANDOWNER WHOSE PROPERTY WAS CONDEMNED BY CITY FOR USE IN RECREATION DEVELOPMENT TO ENJOIN CONSTRUCTION UNTIL ENVIRONMENTAL IMPACT STATEMENT IS FILED).**
381 F. Supp. 100 (M.D. Tenn. 1974).

Descriptors: *Recreation facilities, *Environmental control, *Eminent domain, *Tennessee, Condemnation recreation, Environmental effects, Environment, Construction, Lakes, Ponds, Resources development, Flood protection, Adjacent landowners, Administrative agencies.
Identifiers: *Environmental impact statement, Injunctive relief, National Environmental Policy Act, Standing(Legal).

Landowners, whose property was condemned by the City of Cookeville, Tennessee, filed suit to enjoin further construction and development of a recreation area on the ground that no environmental impact statement was filed and that they had been paid no relocation benefits. The federal district court held the landowners had standing to bring the action but were not entitled to relocation benefits which they had previously declined. In addition, the court found that the proposed project was a major federal action significantly affecting the environment requiring a formal environmental impact statement, but denied an injunction since the construction contracts had not been let but had been merely scheduled for negotiation. The court found it reasonable to permit defendants to advertise the job for bids, execute contracts and finalize bids, subject to preparation of the environmental impact statement. (Gagliardi-Florida)

intiffs sought a declaratory judgment that the
partment of Housing and Urban Development
UD) must conduct an environmental impact
dy prior to approval and registration of a state-
nt of record and property report under the In-
state Sales Act, and sought injunctive relief
uiring HUD to withdraw approval of interstate
d sales filings pending an environmental review
cess. District Court Judge Bohanon found that
intiffs, environmental organizations, demon-
ated actual and potential environmental effects
many aspects of natural wildlife and water-re-
ed and other recreational activities if the
posed development of some 7,000 acres in Il-
is river basin were to occur and that HUD's
roval of documents filed under the Interstate
nd Sales Act was a major federal action, signifi-
tly affecting quality of the environment. Like
other federal agencies, HUD is required under
National Environmental Policy Act of 1969
EPA) to consider the environmental effects of
decisions and to use all practical means to avoid
ironmental degradation. Here, plaintiffs had
the burden of establishing an overriding public
erest in preservation of the area's character and
showing that failure to comply with NEPA
cedures would create a threat of environmental
ry. Thus, the court required HUD to withdraw
approval of the environmental injury. Thus, the
rt required HUD to withdraw its approval of
joint venture at issue in this case and also
dered its declaratory judgment that HUD con-
t an environmental impact study preparatory to
roval and registration of statement of record
property report under the Interstate Sales Act
ll cases. (Gerlach-Florida)

tifiers: Environmental policy, State policy.

petitioner, a land development company,
ht the approval of the New York Department
Environmental Conservation, respondent
in, concerning planned water supply and
ge treatment systems. The systems would
e a vacation home community being
eloped on land owned by the petitioner. The
missioner rejected the applications and peti-
er appealed to the Appellate Division of the
eme Court of New York. The court held that
evidence supported the Commissioner's find-
hat the proposed water supply system did not
uately provide for proper and safe construc-
and for protection from contamination. The
t further held, however, that the evidence did
support a finding that the proposed supply did
meet any public necessity but that the
ence did support a finding that the proposed
ge disposal system consisting of individual
c systems would pollute area lakes. While
ting out that it is not within the Department's
er to reject petitioner's water and sewer
osal based on the aesthetic and ecological un-
ability of the entire development project, the court confirmed the Commissioner's ruling, as modified. (Deckert-Florida)
W75-10314

**SUTHERLAND V. HICKORY NUT CORP. (ACTION FOR DAMAGES CAUSED BY CONSTRUCTION OF ROADS BY ADJACENT PROPERTY OWNER WHICH ALTERED NATURAL DRAINAGE OF MOUNTAIN LAND).**
209 S.E.2d 301-305 (Ct. App. N.C. 1974).

Descriptors: *Adjacent landowners, *Judicial decisions, *Natural flow doctrine, *Obstruction to flow, Natural streams, Watercourses(Legal aspects), Legal aspects, Civil law, Common law, Land tenure, Riparian land, Water law, Water rights, Relative rights, Riparian rights, Alteration of flow, Reasonable use, Natural use, Drainage, Running waters, Land subsidence, *North Carolina.
Identifiers: *Liability(Legal aspects).

Plaintiff sued for damages incurred on his property by defendant's construction of roads on adjacent land resulting in alteration of the natural drainage of surface waters causing mud and silt to stop a drain and damage plaintiff's house and property. Defendant contended that the road did not alter the natural drainage of the water or change its path and that the road was built in conformity with engineering plans. The court followed the 'Civil-Law Rule', which recognizes a natural servitude of natural drainage between adjoining lands, so that the lower owner must accept the surface water which naturally drains into his land. On the other hand, the upper owner cannot change the natural drainage in a manner which would increase the natural burden. The court held that the lower landowner was not required to receive from higher land materials which in the natural condition of the lands would not be carried by the normal flow of surface waters. (Fernandez-Florida)
W75-10315

**DUPONT DE NEMOURS AND CO. V. TRAIN (ACTION BY CHEMICAL MANUFACTURERS TO SET ASIDE REGULATIONS GOVERNING EFFLUENT DISCHARGE OF SULFURIC ACID PLANTS).**
383 F. Supp. 1244-1256 (W.D. Va. 1974).

Descriptors: *Judicial decisions, *Legal review, *Regulation, *Administrative agencies, *Effluents, Wastes, Discharge(Water), Legal aspects, Constitutional law, Jurisdiction, Industrial wastes, Federal jurisdiction, Water law, Administration, Legislation, Federal Water Pollution Control Act, Water Quality Act, Federal government, Water pollution sources, Water pollution.
Identifiers: Administrative regulation, *Federal Water Pollution Control Act Amendments of 1972, Injunctive relief, Effluent limitations, Hazardous substances(Pollution).

An action was brought by chemical manufacturers for declaratory and injunctive relief against the Administrator of the Environmental Protection Agency (EPA), seeking to set aside regulations promulgated by the Administrator governing the effluent discharge of sulfuric acid plants, on grounds that the regulations were arbitrary, capricious, not supported by substantial evidence, beyond the authority of the EPA, and not in accord with procedures of the Federal Water Pollution Control Act Amendments of 1972. Three issues were before the court: (1) whether the Administrator has authority under section 301(b) of the Act to issue regulations establishing effluent limitations for sulfuric acid plants; (2) whether the regulations in question conform to section 304(b) of the Act and the notice and public participation provisions of the Administrative Procedure Act; and (3) whether the district court had jurisdiction to review the regulations in question and the procedures by which they were promulgated. The court concluded: (1) that the Administrator was authorized to promulgate by regulation the effluent limitation in issue; (2) that the structural and content requirements of such regulations under section 304(b) were satisfied; and (3) that judicial review of these limitations and guidelines is vested exclusively in the Court of Appeals. Thus, the court dismissed the action for lack of subject matter jurisdiction. (Fernandez-Florida)
W75-10316

**UNITED STATES V. ST. THOMAS BEACH RESORTS, INC. (ACTION TO ENJOIN OBSTRUCTION TO VIRGIN ISLANDS SHORELINE BY FENCES SEAWARD OF THE MEAN HIGH WATER LINE).**
386 F. Supp. 769-774 (D.C. V.I. 1974).

Descriptors: *Virgin Islands, *Seashores, *Trespass, *Public access, *Public rights, Judicial decisions, Constitutional law, Common law, Shores, Beaches, Boundaries(Property), Coastal structures, Legal aspects, Easements, Riparian rights, Equity, Land tenure, Water law, United States, Federal government, Legislation.
Identifiers: *Injunctive relief, Water rights(Non-riparians).

Plaintiff, United States, sought to enjoin the obstruction of the Virgin Islands shoreline. Defendant, beach resort, had erected chain link and barbwire fences which traversed the beach area. Plaintiff alleged that the inland extension of the fences, obstructing the shoreline, violated the Virgin Islands Open Shorelines Act and contravenes rights or property acquired by the United States by purchase of the islands from the Kingdom of Denmark. Defendant argued that the Open Shorelines Act was unconstitutionally vague and uncertain and that it is in violation of the Revised Organic Act of 1954, which makes impermissible the taking of property without just compensation. The court held that the applicable provisions of the Open Shorelands Act were not void for vagueness and did not amount of a taking of property from abutting landowners without just compensation. In granting that injunction, the court further held that the erection of fenses seaward of the mean high tide mark and the extending of fences inland constituted a trespass upon property belonging to the United States and a manifest interference with the right of the public to enjoy the shoreline. APPLICATIONS OF INTEGER AND QUADRATIC PROGRAMMING TO FLOODPLAIN LAND USE MANAGEMENT,
Massachusetts Univ., Amherst. Dept. of Food and Resource Economics.
J. L. Kaul, and C. E. Willis.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 773, $3.75 in paper copy, $2.25 in microfiche. Paper presented to Operations Research Society, San Juan, Puerto Rico, October 17, 1974. 38 p, 2 fig, 6 tab, 33 ref. OWRT B-043-MASS(1). 14-31-000-3896.

Descriptors: Flood control, *Land use, *Flood plain zoning, Decision making, Non-structural alternatives, Economic efficiency, Methodology, Mathematical models, Algorithms, Connecticut River, Risks, Management, Programming languages.
Identifiers: *Quadratic programming, *Integer programming, *Connecticut River basin.

Methodologies useful to planners at several levels for efficiently managing floodplains using both structural and non-structural measures are provided. The usefulness of these frameworks is demonstrated by applying them to a selected floodplain in the Connecticut River Basin. The algorithms for solving these two decision frameworks employ, respectively, integer and quadratic programming procedures. These frameworks enable the formulation of far more realistic and interesting situations than either of the only two previous applications of operations research methods (both linear programming applications). Major advantages of these two frameworks are that they are cast in a stochastic rather than a deterministic mode (hence enabling the capture of important effects of risk and uncertainty) and presume the demand for land in vario uses to be price flexible. The decision framewo considers floodplain zoning, flood proofing, a other structural alternatives as well as enabling t incorporation of external effects of floodpla development on communities upstream a downstream.

tal of 754 birds were recorded on a portion of a ida pond shore line during 63 visits for 4 mo. wing a controlled burn, while 236 birds were rved on an adjacent and comparable, but un- ed, shore line. Only 5 of the 35 bird species untered were seen more often on the un- ed site. Fire-induced bird and mammal injury ortality was unobserved even though the burn nbled a wildfire. Birds showed no fear of the nd some were attracted to the smoking land- e. Although some cold-blooded vertebrate ality occurred, other herptiles survived, and tors used the burned shore line almost exclu- y. Mammal populations of burned and un- ed areas appeared similar 4 mo. after the fire. al responses are considered related to the fire val of the heavy grass mat that otherwise red the water and soils and the foods con- d therein, and physically impaired new plant th. Burning also produced an earlier, more and far more productive growth of wet- ie plants.--Copyright 1973, Biological Ab- ts, Inc.

ICATION OF NEPA TO EPA'S ENVIRON- AL REGULATORY ACTVITIES.
nmental Protection Agency, Washington,

ble from the National Technical Informa- ervice, Springfield, Va 22161, U.S.D.C., as 158, $4.75 in paper copy, $2.25 in iche. February 1973. 84 p.

iptors: *Environmental control, ronmental effects, *Regulation, Environ- Air pollution, Pesticides, Wastes, Solid , Radiation, Administrative agencies, Ad- rative decisions.

Identifiers: *Environmental impact statement, Administrative regulations, *National Environmental Policy Act.

The National Environmental Policy Act of 1969 (NEPA) requires all agencies of the federal government to prepare, in connection with all major federal actions significantly affecting the quality of the human environment, detailed environmental impact statements. However, such statements have not been prepared for environmental protective regulatory activities taken or concurred in by the Environmental Protection Agency (EPA). The Task Force which investigated the situation concluded that the EPA is entitled to maintain its permit position that NEPA does not legally apply to its regulatory programs. The Task Force reasoned that the application of NEPA to EPA programs would disrupt the agency's operations, and that the benefits to be gained by applying NEPA would not outweigh the significant harm caused by such disruption. The Task Force suggested that courts are likely to be able to resolve the issue in the most efficacious manner. It was the Task Force's recommendation that the Agency pursue a judicial determination that NEPA does not legally apply to its regulatory problems. (Gagliardi-Florida)

**SUMMARIES OF FOREIGN GOVERNMENT ENVIRONMENTAL REPORTS.**
Environmental Protection Agency, Washington, D.C.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-233 430, $3.25 in paper copy, $2.25 in microfiche. No 9, May 1973. 16 p.

Descriptors: *Publications, *Data collections, *Foreign countries, *Foreign research, Governments, Foreign projects, Data processing, Computers, Data storage and retrieval, Information exchange, Investigations, Translations, Information retrieval.
Identifiers: International agreements.

Pursuant to documents exchange agreements with environmental agencies of other countries, the Environmental Protection Agency (EPA) is building an international collection of environmental reports. This is the ninth in a series of announcements of foreign documents received. A computerized search system is being developed which will allow future retrieval of these summaries by country, subject area, and type of document. This series, which is devoted to summaries of government reports and focuses on legislative, economic and social aspects, supplements foreign scientific and technical literature abstracts covered by other EPA information services. Ultimately, the EPA plans to assemble a major collection of foreign government environmental documents and to develop several approaches to the dissemination of the information to EPA staff. These announcements contain brief English abstracts of the listed documents. The original documents may be obtained through the library Systems Branch. More detailed English abstracts and full text translations are also available. (Proctor-Florida)

Identifiers: *Environmental impact statement, Evidence, Injunctive relief.

Citizens groups brought action for declaratory and injunctive relief with respect to development of a

new community under a housing and urban development program. The United States District Court for the Western District of Texas denied the relief sought and entered judgment for the defendants, concluding that the Department of Housing and Urban Development (HUD) had satisfactorily complied with all relevant statutes. Furthermore, the court resolved to retain jurisdiction over the lawsuit for so long as might be necessary to ensure that the proposed environmental safeguards were fully instituted and implemented. The Fifth Circuit Court of Appeals held that the Secretary of HUD acted neither arbitrarily nor capriciously, nor failed to act in accordance with law when he granted developers of the new community federal assistance under the Urban Growth and New Community Development Act; that the environmental impact statement filed by HUD was sufficient; that plaintiffs failed to state claims under the Water Pollution Prevention and Control Act; that in absence of proof that the developer controlled the government agency's actions or caused its default, it could not be cast in judgment for attorney fees; and that as there remained no unadjudicated claim upon which relief could be granted, the trial court had improperly retained jurisdiction. Identifiers: *Congressional hearings, Environmental policy, Nonpoint sources(Pollution), *Chattahoochee River area(Geo).

Hearings were held before the Senate Subcommittee on Parks and Recreation regarding S.1738, which is a bill to authorize the establishment of the Chattahoochee River National Recreation Area in the State of Georgia. The purpose of the legislation is to preserve and protect the natural, scenic, recreational, and historic values of a 48 mile segment of the Chattahoochee River from developments and uses which would substantially impair or destroy them. Emphasis was placed on the special importance of this legislation to the City of Atlanta. In addition to the natural, scenic, historic, educational, and recreational values to the Nation as a whole, this unpolluted segment of the river is the principal water supply for metro Atlanta. Further, it was stressed that additional parkland and open space is critically needed in the rapidly growing metro area. Opinion was expressed that few metropolitan centers have such a major natural resource which can still be preserved and protected from unplanned development. Additional testimony explained the corridor's values in detail. (Fernandez-Florida)

## 7. RESOURCES DATA

### 7A. Network Design

**AN ICE NUCLEI CONCENTRATION BENCHMARK NETWORK,**
National Oceanic and Atmospheric Administration, Boulder, Colo. Atmospheric Physics and Chemistry Lab.
P. A. Allee.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR), WMO No 399, Geneva (Switzerland), p 499-506, 1974. 4 fig, 7 ref.

Descriptors: *Networks, *Measurement, *Nucleation, *United States, Southwest US, Ice, Distribution, Pacific Northwest US, Pacific Ocean, On-site data collections, Equipment, Filters, Atmospheric physics, Meteorology.
Identifiers: *Ice nuclei, Ice nuclei concentrations.

An ice nuclei concentration benchmark network was established in the western United States by the National Oceanic and Atmospheric Administration. The purpose of the network is to determine the climatological mean and variation for the ice nuclei concentration throughout the 17 westernmost states and the north Pacific Ocean. The network consists of field monitors located at 19 National Weather Service locations selected as most likely to be free from anthropogenic sources of ice nuclei. The instrumentation of the network consists of two parts: (1) the equipment for collecting ice nuclei at the field monitoring site, and (2) an NCAR Ice Nucleus Analyzer for the activation and counting of ice nuclei particles on the membrane filter. The data accumulated during May, June, and July 1973 were analyzed. The ice nuclei concentration was partially analyzed on both a daily and a monthly summary basis. No strong correlations between the daily ice nuclei concentration and local meteorological elements were found. No evidence of 'ice nucleus storms' progressing across the network was detected, as previously shown to exist over the north Pacific Ocean. Monthly ice nuclei concentration averag at the network stations showed a monotonic i crease when related to the distance of the stati from the seashore, which can be interpreted th the earth's surface is a source of ice nucl Monthly ice nuclei concentration averages at t network stations increased during May, June, a July 1973. ## 7B. Data Acquisition

FREE-GRAB DEVICE FOR COLLECTING UNDERWATER SAMPLES,
Le Nickel S.A., Paris (France); and Centre National pour l'Exploitation des Oceans, Paris (France). (assignee).
A. Rossfelder.
U S Patent No 3,885,440, 4 p, 1 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 934, No 4, p 1392, May 27, 1975.

Descriptors: *Patents, *Sampling, *Underwater, Bottom sampling, Equipment.
Identifiers: Free-grab sampling device.

A free-grab device is described for collecting underwater samples, particularly poly-metallic nodules deposited on ocean beds, sometimes at very great depths which may be as much as 6,000 meters. The term 'free-grab device' is used to designate sampling equipment which, in contrast to dredges, is released at the surface of the water without being connected to a ship or to a fixed surface installation. The device is caused to sink by a ballast which overcomes the action of one or more floats. When the device touches the sea-bed it releases the ballast automatically and, under float action, rises to the sea surface where it is recovered and where the samples contained are removed. The device is comprised of a box-like frame, the bottom and two sides faces of which are covered at least partially by a orificed wall, the other side faces being uncovered. Two similar pick-up jaws which are fitted with scraping blades and are pivoted on the frame. In the open position they extend generally towards one another and in closed position they are in effective engagement with the uncovered side faces of the frame. Locking means lock the jaws in open position and release means acting on the locking means free the jaws when the device touches the sea-bed. (Sinha-OEIS)

THE ACQUISITION OF INFORMATION DURING ATTEMPTS AT WEATHER MODIFICATION,
Tel-Aviv Univ. (Israel). Dept. of Environmental Sciences.
W. D. Scott.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 353-362, 1974. 4 fig, 1 tab, 6 ref.

Descriptors: *Weather modification, *Measurement, *Data collections, *Cloud seeding, Instrumentation, Radar, Clouds, Sampling, On-site investigations, Model studies, Cloud physics, Meteorology.
Identifiers: Airborne instrumentation.

Unfortunately, in most of the weather modification projects underway, resource limitations are such that little information is available regarding the specifics of the seeding effort. The seeding proceeds, nonetheless, with the hope that the result will be beneficial. It is disquieting that we have accepted such an attitude which stems from the belief that weather modification is truly operational. The general lack of progress in the measurement of cloud elements may be a reflection of this attitude. If a weather modification effort is to have a high probability of success, it must be able to acquire appropriate information and use it for project planning. This information must include variations in sensitive parameters and be statistically significant. It is apparent that most of the present instruments utilize direct sampling techniques and must be supplemented or replaced by instruments which employ remote sensing techniques. Descriptors: *Remote sensing, *Water pollution, *Phytoplankton, *Oil pollution, Electromagnetic waves, Infrared radiation, Fluorescence, Oceans, Freshwater, Tracking techniques, Spectrophotometry.
Identifiers: Laser.

A review of data shows that remote detection of oil films and phytoplankton can be conducted by optical methods as the refractive index of oil is higher than the refractive index of water. In the infrared range, higher values of the reflection coefficient from a surface covered by oil must be expected. A catalogue of the optical properties of oil types and petroleum products in various stages of transformation, to which they are subjected in natural conditions, could be made. The stable correlations between the thickness of an oil layer, its composition and optical contrast in different lighting conditions and the state of the sea surface must be studied. It is important to carry out simultaneous complex measurements in various regions of the electromagnetic spectrum, the results of which could complement each other, and also to carry out independent, direct measurement of the investigated parameters. These methods can be used for detecting oil deposits and also for the search for shoals of fish indicated by increased concentration of phytoplankton. Results showed that the fluorescence method can be used successfully, if a powerful laser is used as an active locator. (Jones-Wisconsin)

ONR Contract N00014-69-A-0200-1060.

Descriptors: *Weather modification, *Evaluation, Effects, *Cloud seeding, *Design, Statistics, Cloud physics, Climatology, Meteorology, Model studies, *Artificial precipitation, Rainfall.
Identifiers: Extra-area effects, Downwind effects.

Because of the inordinate variability of natural rainfall from one unit of observation to the next and because of the changes in rainfall regimes each lasting several years, the only method now known of gaining reliable information on possible effects of cloud seeding is through properly designed randomized experiments. The establishment of rain stimulation technology requires a theory of the atmospheric phenomena resulting from cloud seeding, a theory that is empirically verifiable. This verification can be accomplished only through randomized experiments. The effects of cloud seeding observed empirically in randomized experiments are occasionally positive, occasionally negative, and occasionally no change, and are extensive in both time and place. With reference to summer convective clouds, several interrelated but independently conceived mechanisms of post cloud-seeding phenomena have been suggested. Contrary to experimental situations in many other domains, experiments with rain stimulation are 'multidimensional,' involving such questions as (1) How far does the effect of cloud seeding extend, and (2) When does the effect of cloud seeding begin and when does it end. No statistical theory applicable to such questions exists. Its development requires the cooperation of active mathematical statisticians. (See also W75-09944) (Sims-ISWS)

area, Discharge measurement, Indexing, G
Rivers, Lakes, Streams, Tributaries, S
discharge relations, Water levels.

Hydrometric surveys are conducted by the
Survey of Canada under various agreements
the provinces and territories who contribu
the cost of the basic field investigations
were carried out in accordance with mu
agreed-upon plans. The first edition of a Su
Water Data Reference Index for each provi
region was published for 1966. Subsequen
tions are published annually. The gaging st
are listed by province or territory, in an ups
to downstream order. The main body of this
is a tabulation of stations showing station nu
and name, drainage area, gage location, disc
records, type of gage, operation schedule, a
marks. The names of rivers and lakes for
data are available are given in a station nu
index and an alphabetical index. The overall
racy of hydrometric data referred to depen
(1) the stability of the stage-discharge relatio
or if the control is unstable, the frequen
discharge measurements, and (2) the accura
observations of stage, measurements of disc
and interpretation of records. In general, da
lected during open-water periods are more re
than those collected during periods of ice
tions or those obtained by estimation. Fu
water level data collected utilizing a water
recorder are more reliable and accurate than
using a manual gage only, especially for sm
flashy streams. (Scott-ISWS)

**DISCHARGE MEASUREMENTS AT LOW-FLOW PARTIAL-RECORD STATIONS IN IOWA,.**
Geological Survey, Iowa City, Iowa.
Open-file report, May 1975. 157 p.

Descriptors: *Streamflow, *Low flow, *Iowa, Data collections, Discharge measurement, Basic data collections, Base flow, Gaging stations, Flow characteristics, Hydrologic data.
Identifiers: Partial-record stations(Iowa).

This report compiles discharge measurements made at 433 low-flow partial-record stations in Iowa during the period 1957-74. A low-flow partial-record station is a site at which low-flow discharge measurements are made systematically over a period of years. Most of these measurements were made during periods of base flow when streamflow is primarily from groundwater sources. For estimating characteristics of low flows at a partial record site, the baseflow measurements are correlated with concurrent flows at nearby gaging stations where continuous records are available. By using these relations the flow characteristics at the gaging station are transferred to the partial-record site. The listing starts with streams in the Mississippi River basin (Part 5) and is followed by streams in the Missouri River basin (Part 6). After the station number and name are descriptive paragraphs containing information on the location and the drainage area. These are followed by a tabulation of the discharge measurements in chronological order. (Woodard-USGS)
W75-10144

**HYDROLOGIC DATA FOR URBAN STUDIES IN THE DALLAS, TEXAS METROPOLITAN AREA, 1973,**
Geological Survey, Austin, Tex.
B. B. Hampton.
Open-file report, June 1975. 146 p, 4 fig, 3 tab, 7 ref.

Descriptors: *Hydrologic data, *Urban runoff, *Watersheds(Basins), *Urban hydrology, *Texas, Rainfall, Storm runoff, Data collections, Runoff, Hydrographs, Mass curves, Water yield, Discharge(Water), Urbanization, Watershed management.
Identifiers: *Dallas(Tex).

This report presents the compilation and analysis of hydrologic data collected in urban or partly urban drainage basins in the Dallas, Texas, metropolitan area during the 1973 water year. The objectives of the Dallas area program are: To determine, on the basis of historical data and hydrologic analyses, the magnitude, frequency and areal extent of flooding; to document and define floods of greater than ordinary magnitude; and to determine the effect of urban development on flood peaks and volume. During the 1973 water year, storms producing the highest peak discharges occurred on March 9-10; April 23-24; May 11-12; June 3-4, 19-21; July 7-8; and Sept. 26-27, 1973. These storms produced a variety of rainfall amounts, intensities, durations, and distribution in the drainage basins. Weighted rainfall, for these storm periods upstream from continuous-record gaging stations and selected crest-stage partial-record stations, are given. The storm analyses, hydrographs, and mass curves also are included. (Woodard-USGS)
W75-10148

**HYDROLOGIC DATA FOR NORTH CREEK, TRINITY RIVER BASIN, TEXAS, 1973,**
Geological Survey, Austin, Tex.
R. M. Slade, Jr.
Open-file report, May 1975. 44 p, 2 fig, 3 tab.

Descriptors: *Flood control, *Check structures, *Retaining walls, *Hydrologic data, *Texas, Runoff, *Watershed management, Basic data collections, Watershed protect, *Flood Prev. Act, Water resources development.
Identifiers: Tarrant County(Tex), Trinity River Basin(Tex).

During the period 1951-62, the U.S. Geological Survey began hydrologic investigations in 12 small watersheds in cooperation with the Texas Water Development Board, the Soil Conservation Service, the San Antonio River Authority, the city of Dallas, and the Tarrant County Water Control and Improvement District No. 1. The 12 study areas were chosen to sample watersheds having different rainfall, topography, geology, and soils. In five of the study areas (North, Little Elm, Mukewater, Little Pond-North Elm, and Pin Oak Creeks), streamflow and rainfall records were collected prior to construction of the floodwater-retarding structures, thus affording the opportunity for analyses of the conditions 'before and after' development. A summary of the development of the floodwater-retarding structures in summary of the development of the floodwater-retarding structures in each study area as of Sept. 30, 1973, is tabulated. This watershed-development program will have varying but important effects on surface- and ground-water resources of river basins, especially where a large number of the floodwater-retarding structures are built. (Woodard-USGS)
W75-10149

**HYDROLOGIC DATA FOR MOUNTAIN CREEK, TRINITY RIVER BASIN, TEXAS, 1973,**
Geological Survey, Austin, Tex.
H. D. Buckner.
Open-file report, May 1975. 13 p, 1 fig.

Descriptors: *Hydrologic data, *Watersheds(Basins), *Texas, Streamflow, Discharge(Water), Gaging stations, Rainfall, Water yield, Reservoirs, *Watershed management, Flood control, Retaining walls, Reservoir yield, Water levels.
Identifiers: *Mountain Creek(Tex), *Trinity River basin(Tex).

The stream-gaging stations on Mountain Creek near Cedar Hill and Walnut Creek near Manfield, Texas provide hydrologic data to define runoff characteristics from small drainage basins. They also serve as index stations for inflow into the reservoir and provide operational data for the reservoir. In addition, the station Walnut Creek near Mansfield is equipped with a recording rain gage. The stage station near Duncanville provides data pertinent to operation of the gates in the Mountain Creek Lake Dam. The reservoir-content station at the dam provides records of reservoir stage and contents. The stream-gaging s

**ARTIFICIAL REEF,**
E. R. Boots.
US Patent No 3,888,209, 6 p, 6 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 935, No 2, p 547, June 10, 1975.

Descriptors: *Patents, *Beach erosion, Shore protection, Coastal structures, Reefs, Deposition(Sediments).
Identifiers: Artificial reefs, Marine organisms.

The object of the invention is to provide a practical method and apparatus for offshore reef construction which serves to correct an imbalance in the natural accretion-degradation cycle so as to prevent substantial erosion of a beach area by the net movement of beach materials away from the shore. An offshore submerged reef structure is in a form which may be transported to and placed in the desired offshore location and built up to a desired height. The base reef element is preferably secured to the ocean floor by pile members or stakes which are passed through the base element and driven into the ocean floor. The base reef element is preferably of inverted U-shaped cross section having openings to permit sand and other particulate matter normally held in suspension in the sea water to deposit and settle within the reef structure to afford it greater anchorage and stability. The base reef element may serve as the habitat for an implanted marine organism, such as a sabellariid organism, which over the years will continue to grow and build up the size and height of the reef. Composite artificial reefs are arranged end-to-end and relative to the shoreline so as to interfere with the destructive shoreline currents by deflecting the incoming waves. (Sinha-OEIS)

Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
D. A. Gray.
Journal of the Hydraulics Division, Proceedings of ASCE, Vol 100, No HY2, Paper No 10354, p 267-277, February 1974. 1 fig, 1 tab, 2 ref.

Descriptors: *Dams, *Safety, *Hydraulics, *Governments, *Reclamation, *Water resources, *Spillways, *Reservoirs, Design, Earthquakes, Floods, Hydrology, Legislation, Landslides, Water supply, Water works, Concrete dams, Earth dams, Maintenance.
Identifiers: Systems engineering.

The program of the Bureau of Reclamation for monitoring the safety of its existing dams includes periodic examinations, dam behavior measurements, spillway capacity reevaluations, seismic and other structural reevaluations, operating instruction documentation and updating, and landslide and upstream dam surveillance. The Bureau has responsibility for the safety of dams for 240 reservoirs with capacities ranging from 1,000 acre-ft. to 29,755,000 acre-ft., all located in 17 western states. Its reservoirs of 5,000 acre-ft. or more in capacity total approximately one-tenth of those in the United States. Recent studies have revealed that a substantial number of Bureau dams constructed before 1950 require spillway capacity determinations using present day hydrologic techniques and data. The adequacy of spillway capacity at older dams of significant size in the United States should be reviewed. (Bell-Cornell)

Available from the National Technical Information Service, Springfield, Va 22161 as USDC, EIS-UT-73-1289-F-1, $21.25 in paper copy, $2.25 in microfiche. August 2, 1973. 941 p, 56 map, 32 tab, 24 fig, 6 graph, 13 photo.

Descriptors: *Utah, *Diversion structures, *Irrigation systems, *Water supply development, Reservoirs, Pumping plants, Aqueducts, Tunnels, Canals, Drains, Dikes, Industrial water, Wildlife habitats, Fishing, Recreation, Salinity, Colorado River, Aesthetics, Community development.
Identifiers: *Environmental impact statements, *Uinta Basin(Utah), *Bonneville Basin(Utah).

The project will divert water from the Uinta Basin in the Bonneville Basin in Utah. This will be accomplished by construction of new reservoirs and enlargement of existing reservoirs; construction of 140 miles of aqueducts, tunnels and canals; three power plants; nine pumping plants; 13 miles of dikes and 200 miles of pipe drains. The project will

supply immediate and projected water needs for irrigation, municipal and industrial needs and power production. In some areas, the project will have a significant adverse effect on fish and wildlife habitats as well as loss of quality fishing and stream recreation. In the areas of the reservoirs, however, fishing and water related sports will be substantially increased. Two other effects will be increased salinity of the Colorado River and permanent aesthetic land changes. Alternatives considered were alternate sources of water, various scales of partial construction or non-construction of authorized unit and alternative location. (Altuve-Florida)

**INITIAL STAGE, GARRISON DIVERSION UNIT, PICK-SLOAN MISSOURI BASIN PROGRAM, NORTH DAKOTA (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Bureau of Reclamation, Billings, Mont. Upper Missouri Region.
Available from the National Technical Information Service, Springfield, Va 22161 as USDC, EIS-ND-74-0058-F, $17.25 in paper copy, $2.25 in microfiche. January 10, 1974. 740 p, 61 fig, 22 dwg, 12 tab, 2 append.

Descriptors: *Environmental effects, *Missouri River, *North Dakota, *River basin development, *Water supply development, Central U.S., Reservoirs, Irrigation water, Reservoir construction, Water yield improvment, Recreation, Water management(Applied), Water distribution(Applied), Irrigation systems, Diversion, Alteration of flow, Canals, Irrigation canals, Lateral conveyance structures, Agriculture, Wildlife habitats, Lakes, Streamflow, Federal government, Water resources development.
Identifiers: *Environmental impact statements, Missouri River(ND), Lake Lakakamea(ND).

The project entails construction of a system of reservoirs, canals, and laterals to divert water from the Missouri River and Lake Lakakamea in the Missouri Basin of North Dakota. About 30% of the population of North Dakota resides in the project area, which is predominantly rural and agricultural. As a result of the project, substantial water supplies will be provided for irrigation, municipal and industrial use, fish and wildlife developments, outdoor recreation, and improvement of base flows of local streams. Adverse environmental effects include a 5% flow depletion in the Missouri River, increased stream salinity, stabilized flow of intermittent streams, intrusion of rough fish, and inundation of some archaeological sites. Alternatives considered were: no development, precipitation management, use of ground water, alternate locations, and modification of planned distribution systems. Although the short-term uses of the area will be hampered by construction activity and temporary disruption of wildlife habitats, long-term benefits will be gained in agriculture, water resources and quality, recreation, and the economy. In addition to commitments of water and land resources, electric power, construction materials, and public and private funds, there will be irreversible losses of vegetation, wildlife, archaeological, and mineral resources. Comments indicated overwhelming support of the project. (Fernandex-Florida)

**CLAYTON LAKE, JACK FORK CREEK, OKLAHOMA (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Army Engineer District, Tulsa, Okla.
Available from the National Technical Information Service, Springfield, Va 22161 as USDC, EIS-OK-74-0199-F.

Descriptors: *Environmental effects, *Oklahoma, *Dam construction, *Flood routing, *Water supply, Dams, Check structures, Damsites, Water control, Water storage, Water management(Applied), Flood control, Water supply development, Federal government, Flood protection, Streams, Artificial lakes, Archaeology, Recreation, Agriculture, Lumber, Wildlife, Waterfowl, Vegetation effects.
Identifiers: *Environmental impact statements, *Clayton(Okla), Dam effects, Jackfork Creek(Okla).

The project involves the construction of a dam and lake on Jackfork Creek, north of Clayton, Oklahoma. The mountainous terrain is covered with timber of commercial value, and small areas are used for pasture and cultivation. Significant reduction of annual flood damge and production of a dependable water supply are expected to be the main impacts of the project together with enhanced recreational resources. Adverse results will be suffered by animal and plant life, stream-oriented recreation, archaeological sites, and numerous families, roads, and utility lines which must be relocated. Alternatives considered were: (1) no action, (2) defer water management to other government agencies, (3) construct a dry lake, (4) utilize upstream multipurpose projects, (5) use levees, and (6) acquire flood plain rights. The benefits of the lake to the area outweigh maintaining the status quo because the project will enhance the environment for a larger number of people than is possible under the present use. Resources committed to developing lands for the present agricultural use and costs of dam construction and road relocation cannot be regained. Generally, comments indicated concern over destruction of the present environment. (Fernandez-Florida)

**WARM SPRINGS DAM AND LAKE SONOMA PROJECT, RUSSIAN RIVER BASIN, SONOMA COUNTY, CALIFORNIA, PART I (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Army Engineer District, San Francisco, Calif.
Available from the National Technical Information Service, Springfield, Va 22161 as USDC, EIS-CA-73-1910-F-1, $10.50 in paper copy, $2.25 in microfiche. December 10, 1973. 415 p, 4 fig, 15 plate, 16 photo, 5 append.

Descriptors: *Dams, *Reservoirs, *Channel improvement, *Water supply, *Flood protection, *Channel improvement, *Water supply, *Flood protection, Levees, Earth dams, *California, Recreation, Fish hatcheries, Environmental effects, Erosion, Dusts, Turbidity, Air environment, Wildlife, Mosquitoes, Litter, Water supply development, Anadromous fish, Flood plains.
Identifiers: *Environmental impact statements, *Dry Creek(Calif).

The project entails the construction of an earthfill dam 319 feet high on Dry Creek, California, which will impound a reservoir having a capacity of 381,000 acre-feet. The project includes recreation facilities, a fish hatchery, and channel improvements. A total of 17,650 acres of land will be acquired. Short-term environmental effects of the project include increased erosion, dust and stream turbidity, changed air quality, increased noise, loss of wildlife habitat, unsightly spoil disposal, clearing operations, cut slopes, increased liter, mosquitoes, and rattlesnake exposure. The long-term environmental effects include increased water supply, decreased flooding of downstream areas, changed stream flow regime, reduced downstream sediment transport, changed channel conditions, gravel operations and closure pattern, improved anadromous fishery, increased recreational opportunities and traffic, and the possibility of reduced seismic ability. The following alternatives were considered: other scales of development at the same site; selection of another nearby site for the dam; construction of one or more other dams; combination of non-reservoir alternatives, such as levees, wastewater reclamation, better utilization of existing water supplies, control of flood plain land uses, and no action. purpose was to acquire both qualitative and
titative knowledge of flow characteristics
lting from the sudden release of water from
end of a long, straight flume of rectangular
s section. The flume bottom was adjusted to a
zontal plane, filled to the desired still water
h, and the quick-opening gate was released.
ie cameras were located on a line parallel to
ong axis of the flume in order to photograph
vater movements at 5 predetermined stations.
chronized clocks were located along the flume
at each station and indicated the time after the
se of the gate. Dye was injected into the water
vertically spaced openings at each station at
us time intervals. The glass wall of the flume
marked with a grid system at each station so
photographs showed the position of the dye,
vater depth, and the time. This procedure per-
d the determination of the velocity at any
depth, and station. Volume changes from the
le enabled the calculation of average veloci-
Tests were conducted with the flume horizon-
nd filled to 4 different initial depths. The
ement of the dye at each station immediately
the sudden release of the gate was studied.
advancing dye front presented a velocity dis-
tion curve.

Irrigation canals.
ifiers: V-notch weirs.

harge measurement of small streams, irriga-
canals, sewers, and other open channels can
tisfactorily achieved with the use of V-notch
. The four sizes of V-notches commonly used
0, 60, 45, and 22.5 deg. The size selected will
nd on the expected maximum flow and the al-
ble depth over the weir. Minimum recom-
ded depths of flow over V-notch weirs were
for 90 deg, and 0.1 ft for 45 and 22.5 deg. If a
operator instrument is used to continuously
d the water level, it is important to select a
size that will give at least 0.3 ft of head for the
ge low-flow condition. Construction sug-
ons were discussed for installation of tempo-
and permanent weirs. Discharges in cubic feet
econd and million gallons per day were tabu-
for each weir size for heads ranging from 0.1
9 ft. (Humphreys-ISWS)

RODYNAMIC LEVELLING OF AN OFF-
RE TIDE GAUGE,
ute of Oceanographic Sciences, Taunton
land).
Alcock, and D. T. Pugh.
In: The Institution of Civil Engineers Proceedings, Part 2, Research and Theory, Vol 59, p 123-137, March 1975. 6 fig, 3 tab, 7 ref.

Descriptors: *Tides, *Hydrodynamics, *Waves(Water), Mathematical models, Hydraulics, Water levels, Europe, Oceanography, Shallow water, Coasts, Gages, Currents(Water), On-site data collections, Model studies.
Identifiers: *Offshore tides, *Offshore water levels, Tidal cycle.

When designing structures which extend to a considerable distance offshore, it is desirable to have offshore measurements of water level which are referred to the same datum as simultaneous coastal measurements. By using the hydrodynamic equations and only limited current observations, a datum level was transferred to a gage 12.9-km offshore in the Wash on the east coast of England, across water of 7.5-m average depth, where the mean spring tidal range is 6.4 m. Mean values over a lunar tidal cycle were computed. By calculating the datum level on an hourly basis as well, the apparent datum variations were used to investigate the limitations of the simple model applied. Level transfer was estimated to be accurate to within 0.04 m; the maximum uncertainty arises in estimating the residual gradients due to advection and bottom friction terms. (Lee-ISWS)

**DESIGN IMPLICATIONS OF HYDRAULIC JUMPS AT SUDDEN ENLARGEMENTS,**
Mozambique Univ., Lourenco Marques. Dept. of Civil Engineering.
L. E. de M. Magalhaes, and P. Minton.
In: The Institution of Civil Engineers Proceedings, Part 2, Research and Theory, Vol 59, p 169-174, March 1975. 5 fig, 1 tab, 7 ref.

Descriptors: *Hydraulic jump, *Hydraulic models, *Hydraulic design, Open channel flow, Open channels, Hydraulics, Steady flow, Jets, Sluice gates, Channels, Gate control, Laboratory tests, Model studies, Cross-sections.
Identifiers: *Sudden enlargement channels, Channel geometry.

A laboratory model study was described of the formation of hydraulic jumps at the junction between a narrow open channel with a fast flow and broad open channel with a slow flow (both flows in the same direction). The channels were rectangular in cross section with parallel side walls and a horizontal bed. The size of the model was large enough to suggest that the results should be applicable to full-scale river situations. The flow in the jet from the 0.2-m wide sluice gate in the narrow channel was measured by a calibrated orifice meter. The depth and Froude number of the jet were calculated from the depth upstream of the sluice by the energy equation. An independent water supply was provided for the 0.54-m wide broad channel to give a flow in the same direction as the flow in the narrow channel. The depth of water in the combined downstream channel, measured on the center line 2 m from the sluice, was controlled by the downstream weir. The results indicated that when a hydraulic jump occurs where it is not constrained to two dimensions, it will assume a form (oblique, normal, or submerged) appropriate to the conditions. The effects of many variables, such as the channel breadth ratio and the angle between the broad channel flow and the flow from the sluice, must be studied for a complete understanding of hydraulic jump formation. However, the information obtained confirms that hydraulic jumps at sudden enlargements form at a lower downstream depth than two-dimensional theory would indicate. Thus, a jump forming at an enlargement can submerge a sluice with a downstream depth less than that required to submerge the sluice in a two-dimensional flow. (Lee-ISWS)

**FRICTION COEFFICIENTS FOR LAMINAR SHEET FLOW OVER ROUGH SURFACES,**
University of the West Indies, Kingston (Jamaica).
H. O. Phelps.
In: The Institution of Civil Engineers Proceedings, Part 2, Research and Theory, Vol 59, p 21-41, March 1975. 16 fig, 5 tab, 17 ref.

Descriptors: *Roughness(Hydraulic), *Sheet flow, *Overland flow, *Laboratory tests, *Flow resistance, Fluid mechanics, Reynolds number, Froude number, Hydraulics, Transition flow, Friction, Laminar flow, Dimensional analysis, Boundary layers.
Identifiers: Relative roughness.

Systematic tests of sheet flow in the laminar and transition regions were carried out on eight surfaces of varying degrees of roughness. The Darcy friction coefficient was the primary dependent variable. Analysis of the results showed that the product of the Darcy coefficient and the Reynolds number, a constant in steady laminar flow on a smooth surface, was a function of the relative roughness. It was also found that the critical value of the Reynolds number decreased as the relative roughness increased. Measurable effects, similar to those observed in turbulent flow over rough surfaces, were produced by changes in shape and concentration of roughness elements. The association of roll waves with the beginning of the transition region suggested that this form of instability contributed to the change of flow regime and lead to the conclusion that the Froude number was significant. The possibility of developing a roughness standard was explored. (Adams-ISWS)

**A MODEL FOR EARTHQUAKES NEAR PALISADES RESERVOIR, SOUTHEAST IDAHO,**
Geological Survey, Denver, Colo.
D. Schleicher.
Available from Sup Doc, GPO, Wash., D.C. 20402, $3.15 single journal copy, $18.90 yearly subscription rate. Journal of Research of the U.S. Geological Survey, Vol 3, No 4, p 393-400, July-August 1975. 7 fig, 21 ref.

Descriptors: *Earthquakes, *Reservoirs, *Model studies, *Idaho, Faults(Geologic), Water levels, Stress, Seasonal, Seismic properties.
Identifiers: *Palisades Reservoir(Idaho), Epicenter.

The Palisades Reservoir, Idaho, seems to be triggering earthquakes: epicenters are concentrated near the reservoir, and quakes are concentrated in spring, when the reservoir level is highest or is rising most rapidly, and in fall, when the level is lowest. Both spring and fall quakes appear to be triggered by minor local stresses superposed on regional tectonic stresses; faulting is postulated to occur when the effective normal stress across a fault is decreased by a local increase in pore-fluid pressure. The spring quakes tend to occur when the reservoir level suddenly rises: increased pore pressure pushes apart the walls of the graben flooded by the reservoir, thus decreasing the effective normal stress across faults in the graben. The gall quakes tend to occur when the reservoir level is lowest: water that gradually infiltrated poorly permeable zones during high reservoir stands is then under anomalously high pressure, which decreases the effective normal stress across faults in the poorly permeable zones. (Woodard-USGS)

VALVE STROKING IN SEPARATED PIPE FLOW,
Edinburgh Univ. (Scotland). Dept. of Mechanical Engineering.
M. Driels.
Journal of the Hydraulics Division, Proceedings of ASCE, Vol 100, No HY11, Paper No 10940, p 1549-1563, November 1974. 12 fig, 34 equ, 9 ref, 4 appen.

Descriptors: *Valves, *Hydraulics, *Water hammer, *Cavitation, Pipe flow, Piping systems(Mechanical), Air entrainment, Surges, Equations, Simulation analysis, Computer programs, Velocity, Control, Algorithms, Mathematical models.
Identifiers: Fluid flow, Transients, Prediction, Steady-state pressure, Valve closure, Linear closure, Method of characteristic.

Apart from assessing the magnitude of a pressure surge propagated within a pipe flow system, the engineer needs to be able to reduce the surge, possibly using a process known as valve stroking. Although methods of valve stroking exist, they are not applicable to systems in which flow separation occurs due to the loss of control by the valve on the separated column. Developed are two methods for dealing with such a situation. It is shown that for the first method, a surge reduction of 40% is typical; these results are supported by experimental evidence. The second method indicates that a 95% reduction in the surge is possible, although at present no experimental data are available to confirm this. (Bell-Cornell)

TRANSFORMATION OF MOODY DIAGRAM,
Haile Sellassie I Univ., Addis Ababa (Ethiopia). Dept. of Civil Engineering.
K. C. Asthana.
Journal of the Hydraulics Division, Proceedings of ASCE, Vol 100, No HY6, Paper No 10624, p 797-808, June 1974. 1 fig, 1 tab, 21 equ, 2 ref.

Descriptors: *Pipe flow, *Hydraulics, *Darcys law, *Moody resistance diagrams, Headloss, Friction, Equations, Pipes, Size, Velocity.

The Moody diagram has been extensively used for the solution of pipe flow problems. A revised pipe flow diagram between dimensionless parameters is developed based on the transformation of the Moody diagram with the help of the Darcy equation. The revised diagram eliminates the repeated use of the Darcy equation, the friction factor, and the need of successive trials in the solution of pipe flow problems. It provides a more direct, simple, and convenient means of solving pipe flow problems within the range of accuracy expected from the original Moody diagram. (Bell-Cornell)

GEOTHERMAL BRINE ENERGY TO GENERATE POWER,
Chevron Research Co., San Francisco, Calif. (assignee).
J. R. B. Ellis, and A. W. Pryor.
U S Patent No 3,862,545, 3 p, 1 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 930, No 4, p 1761, January 28, 1975.

Descriptors: *Patents, *Geothermal studies, *Thermal properties, *Subsurface waters, Brines, Salts, Electric powerplants, Steam turbines, Energy.

A process is described for using energy from a hot brine to generate power. The process consists of flashing the hot brine in a flash zone to form steam and a concentrated brine. The steam is used to drive a power-generating turbine. Exhaust steam from the turbine is condensed. This condensate from the turbine exhaust is combined with the concentrated brine to form a restored brine and consequently the restored brine is returned to the source of the hot brine. Oxygen is excluded from the system to minimize corrosion. The flash zone contains at least one flash drum and preferably the hot brine is flashed without any substantial crystallization of the soluble salts. (Sinha-OEIS)

SUBMERSIBLE PUMPS MAKE BY-PASS POSSIBLE,
Los Angeles County Sanitation District, Whittier, Calif.
J. A. Redner, and J. E. Kenmir.
Water and Wastes Engineering, Vol 12, No 4, p 62, 64, April, 1975.

Descriptors: *Pumps, Valves, Pipes, Flood control, Equipment, Installation, Sewerage, *Waste water treatment, *California.
Identifiers: *Los Angeles County(Calif), Submersible pumps, Pumping stations.

Five submersible pumps in Los Angeles County, California, have been installed to provide emergency by-pass of waste water pumping stations. This installation was in response to a flooding in 1972 when power was lost and waste water from a wet well flooded the pump house. Portable s
mersible pumps were chosen because of operat
reliability. Of the pumping stations in the Los A
geles district, 23 have volume and head conditi
in the correct range for high-capacity electric s
mersible pumps. Of these stations, conditi
range from 9000 gpm at 26 feet to 1200 gpm at
feet. Extreme emergency conditions would requ
two pumps in parallel to handle the flow. T
pumps ordered consist of two 30 hp Flygt Mo
CS 3200, two 77 hp High Volume Flygt Model
3300, and one 88 hp High Head Flygt Model
3300. In an emergency, a pump will be rushed
truck to the disabled pump station. A qu
coupling discharge pipe can be connected t
flanged fitting on the pump and the pump
discharge pipe will be lowered into a pump
manhole along guide rails. The free end of the
minum discharge pipe will then be connected t
permanently installed force main connection p
using a victaulic coupling. The entire connect
operation should average only thirty minutes
fore actual by-pass pumping begins. (Prag

WASTEWATER LIFT STATION OPENS W
TO URBAN EXPANSION.
The American City, Vol 90, No 3, p 59-60, Mar
1975.

Descriptors: *Pumps, Sewerage, Installati
Sewage treatment, Maintenance, Equipme
Waste water treatment, Illinois.
Identifiers: *Pump stations, Homewood(Ill).

A pre-engineered underground pump station
built and installed in Homewood, Illinois in or
to control the sewerage system of an expanding
sidential development. This lift station is capa
of transferring up to 8.3 mgd of sewage collec
from the annexed area to the Homewood receiv
line. The station has three pumps, with two
these already put into operation. Sewage will fl
into a 4000 gallon wet well; as this well fills, b
pressure on a compressor-operated air bubbler
creases until a mercury pressure switch is ac
ated. At a pre-determined level, the switch en
gizes one of the two pumps. The mercury press
of each pump is set so that both pumps n
operate during periods of maximum flow,
tributing their work evenly. The pumps t
discharge the sewage through a check valve an
discharge gate valve to a force main; the sew
then flows by gravity for another one and
quarter miles to the treatment plant. Each pum
rated at 4200 gpm against a total dynamic heac
38 feet and is driven by 60 hp, 875 rpm electric
tors. Only a six-week installation period
required for the entire station, which arrived p
constructed from Ecodyne in Kansas. Thus
maintenance has been minimal, and records
meter readings are kept daily. (Prague-FIRL)

tifiers: Fuel reprocessing.

of the major problems facing our society are the growing demands for energy and the tion associated with its generation. World ves of fossil fuels alone will not meet these nds, and it is obvious that other power es, such as nuclear fission, must supplement ombustion processes currently used. In this r, the major environmental hazards as- ted with both fossil fuelled and nuclear power ns are discussed, using data both from Aus- and overseas. The environmental and biolog- effects of air pollution, thermal pollution, active effluent from power stations and fuel cessing plants, and radioactive waste sal are dealt with, and the safety of nuclear r stations discussed. Two methods are out- for the comparison of hazards associated fossil fired and nuclear plants, and one of is used in the analysis. The paper is not in- d to provide an exhaustive study of the sub- ut rather to indicate the major points of con- and to illustrate a possible approach using a e model for such environmental com- ns. LIQUEFACTION BY TORSIONAL SIM- HEAR DEVICE,
ington Univ., Seattle. Dept. of Civil En- ring.
bashi, and M. A. Sherif.
Journal of the Geotechnical Engineering Division, American Society of Civil Engineers, Vol 100, No GT8, p 871-888, August 1974. Paper 10752. 19 fig, 4 tab, 4 ref.

Descriptors: *Soil liquefication, *Shear, *Measurement, Stress, Earthquakes, Shear device, Laboratory tests, Equipment.
Identifiers: *Torsional simple shear device.

As a result of severe earthquakes, structural damage due to soil liquefaction has become an area of study in many research laboratories. A simple shear device, the conventional equipment for liquefaction laboratory study, has several difficulties. A new instrument eliminates such effects as wall friction without sacrificing requirements of duplicating in situ stress and strain conditions. The new instrument called the Torsional Simple Shear Device, was compared with the simple shear test equipment. It was found that with the Torsional Simple Shear Device one can check and verify the adequacy of the amount of soil saturation prior to cyclic testing and one can study the effects of lateral soil confinement on the liquefaction potential of the test sample. In addition, the Torsional Simple Shear Device tests the soil with a unique cross-sectional area and imposes uniform shear strains and stresses, thus providing more reliable experimental results. BIG HILL LAKE CREEK, KANSAS (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Tulsa, Okla.
Available from the National Technical Information Service, Springfield, Va 22161 as USDC, EIS-KS-73-1621-F, $8.50 in paper copy, $2.25 in microfiche. October 11, 1973, 271 p, multiple tab, multiple map.

Descriptors: *Multiple-purpose reservoirs, *Environmental effects, *Kansas, *Dam construction, *Earth dams, Watershed management, Watersheds(Basins), Water supply development, Water supply, Flood protection, flood plains, Flooding, Engineering structures, Multiple-purpose projects, Artificial lakes, Federal government, Water conservation, Wildlife habitats, Recreation, Embankments, Impoundments, Flood control.

This project is located on Big Hill Creek in southern Kansas and calls for the construction of a lake for flood control, water supply, and recreation. A 4,425-foot long earthen embankment will be constructed creating a lake having a capacity of 40,600 acre-feet at the top of the flood pool. The project site is a predominantly agricultural and rural area. Construction of the lake will largely eliminate flood damage in the area below the dam and will provide 8.5 million gallons per day of high quality water supply for the next 100 years. 2700 acres of cropland, pasture and woodland will be committed to the project, with 1240 acres inundated by the conservation pool and another 280 acres subject to periodic flooding. 12 miles of stream habitat will be lost and nine archaeological sites will adversely affected. Various combinations of dry lakes and water supply lakes, various flood plain management programs, and no action were among alternatives considered. The project will enhance the long term productivity of the region, and except for construction materials, will require no irretrievable commitment of resources. The area inundated will be committed for the life of the project. There appears to be no significant oppositon to this project. (Deckart-Florida)

## 8I. Fisheries Engineering

MARKING ALEWIFE FRY WITH BIOLOGICAL STAINS,
Department of the Environment, Halifax, (Nova Scotia). Fisheries Service.
B. M. Jessop.
Prog Fish-Cult, Vol 35, No 2, p 90-93, 1973.
Identifiers: *Alewife, Alosa-pseudoharengus, *Biological stains, Fry, *Fish marking, Fish handling.

Bismark brown Y was more suitable than neutral red from the immersion staining of young alewives (Alosa pseudoharengus). It was less toxic than neutral red and produced an identifiable mark for a longer time. Should the difficulties experienced in handling these fish be overcome, the marking method may be of practical use in population estimates.--Copyright 1973, Biological Abstracts, Inc.

INFLUENCE OF LIGHT INTENSITY ON THE BIOENERGETICS OF CHANNEL CATFISH,
Missouri Univ., Columbia.
E. F. McDonald.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-73-11007, $3.75 in paper copy, $2.25 in microfiche. MS thesis, May 1973. Report No. NOAA-73052409. 36 p, 2 fig, 5 tab, 11 ref. NOAA 2-164-R.

Descriptors: *Fish behavior, *Light intensity, *Animal physiology, *Channel catfish, Fish diseases, Animal growth, Productivity, Respiration, Water quality, Growth rates, Metabolism, Aquiculture, Economics, Oxygen requirements.

The primary objective was to measure growth and food conversion of the channel catfish, Ictalurus punctatus, as affected by light. Also studied were the behavior, metabolism, feeding, and growth at different light intensities. Investigations were conducted under three light intensities of full, 1/10th full, and negligible. For the larger fish there was significantly greater growth under negligible light intensity. For small fish there was no significant difference between weight gain under different light conditions. Oxygen consumption indicated that for the larger fish the differences between activity curves at each intensity were not great, but the medium intensity curve showed the highest levels of activity. For the small fish oxygen consumption curves indicate that activity pattern of fish under medium and high light intensity were nearly identical except that fish activity under high light intensity appears to be more depressed during the hours of light. Medium and high light curves show the highest levels of activity at 'lights on' and 'lights out' with the lowest levels during the hours of light. Light intensity must be considered only a secondary determinant of success and efficiency in catfish production when compared to the problems associated with pathology; both parasitic and bacterial diseases were evident. **RECOMMENDATIONS FOR ENVIRONMENTAL ENGINEERING EDUCATION,**
Northwestern Univ., Evanston, Ill. Dept. of Civil Engineering.
W. O. Pipes.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 100, No EE2, Paper No 10459, p 243-252, April 1974.

Descriptors: *Water pollution, *Water quality control, *Education, *Environmental engineering, Land use, Natural resources, Air pollution, Public health, Radiation, Protection, Research, Sanitary engineering, Solid wastes, *Manpower.
Identifiers: Accreditation, Continuing education, *Engineering education, Fellowships, Industrial hygiene, Professional advancement, Public works, Refuse disposal.

Presented is a summary and discussion of the recommendations which were put forth at the Third National Conference on Environmental Engineering Education held at Drexel University, Philadelphia, in August 1973. Reports and proposed recommendations were originally developed by seven committees in preparation for the Conference. The proposed recommendations were discussed and modified and some were adopted at the Conference. The recommendations are concerned with the identity of, the manpower needs for, and educational programs for environmental engineering. A large number of civil engineers and some engineers with other educational backgrounds have identified with environmental engineering as a field of practice. The field is broad because it is concerned with protecting human populations from environmental hazards and with protecting environments from the effects of human activities. (Bell-Cornell)

1974. 69 p, 1 fig, 19 photo, 1 tab, 38 ref. OWRT A-999-ALA(3).

Descriptors: *Alabama, *Water quality control, *Water resources development, *Water supply development, Agriculture, Water pollution, Water, Water quality, Water quality standards, Water resources, Water supply, Water conservation, Water pollution control, Water pollution effects, Water pollution sources, Water pollution treatment, Pollutant identification, Pollutants, Pollution abatement, Waste water(Policy), Waste water treatment, Wastes, Waste treatment, Waste water disposal.
Identifiers: Hazardous substances(Pollution).

Alabama's most pressing water problems are in the area of water quality management and protection and in water resources planning. Other problem areas highlighted by the state's new Water Resources Research Advisory Committee are included in the categories of water cycle and water supply augmentation and conservation. Principal areas considered include: the nature of water, the water cycle, conservation in agriculture, identification of pollutants, sources and fate of pollution, the effects of pollution, waste treatment processes, ultimate waste disposal, water quality control, techniques of planning, evaluation processes, cost allocation, cost sharing, and pricing and repayment. # CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

**Supported by the Environmental Protection Agency in cooperation with WRSIC**

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

# SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
NOV 20 1975
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 8, NUMBER 21
NOVEMBER 1, 1975

-10351 -- W75-10850
DEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription rates are: To the SWRA Journal, $75 ($95 foreign); to the Journal & Annual Index, $100 ($125 foreign); to the Annual Index only, $50 ($65 foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

# SELECTED
# WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

**VOLUME 8, NUMBER 21**
NOVEMBER 1, 1975

W75-10351 -- W75-10850

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

# FOREWORD

**Selected Water Resources Abstracts,** a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

**Selected Water Resources Abstracts** is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

## CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

**01** NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

**02** WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

**03** WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

**04** WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

**05** WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

**06** WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

**07** RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

**08** ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

**09** MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

**10** SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

**EMOVAL OF PERIODICITIES BY DIF-RENCING AND MONTHYL MEAN SUB-RACTION,**
rdue Univ., Lafayette, Ind. School of Civil En-neering.
L. Kavvas, and J. W. Delleur.
ailable from the National Technical Informa-n Service, Springfield, Va. 22161, as PB-243 5, $3.75 in paper copy, $2.25 in microfiche. 974). 23 p, 4 fig, 5 ref. OWRT B-036-IND(4).

scriptors: *Time series analysis, Stochastic ocesses, Time lag, Statistical methods, Hydro-aphs, Hydrologic aspects, Mathematical odels, Seasonal, Monthly.
entifiers: *Hydrological sequences, eriodicity, ARMA models, Spectral density, asonal differencing, Non-seasonal differencing.

e spectral representation of periodic hydrologic e series has both a continuous and a discrete rt which represent the periodic and stationary ndom components, respectively. With this presentation, seasonal and non-seasonal dif-encing and manthly mean subtraction methods the removal of the periodic component were alyzed for the case of monthly series. It is own both analytically and by an exapmple that asonal differencing removes and nonseasonal ferencing effectively reduces the periodicity in t covariance function. However, both kinds of ferencing greatly distort the original spectrum, oing out the original spectral contribution at the gin and greatly reducing it near the origin. The t to the distorted spectrum by ARMA models th few parameters is almost impossible and the ted models are impractical for hydrologic simu-lion since they either yield an infinite variance or undefined at the spectral origin. Subtraction of nthly means completely removes the periodici-in the covariance but introduces a different type nonstationarity which is negligible for practical poses.

**OCEEDINGS SYMPOSIUM ON STATISTI-CL HYDROLOGY.**
ricultural Research Service, Washington, D.C.
sale by the Superintendent of Documents, U. Government Printing Office, Washington, D. 20402 - Price $3.70. Symposium held at rizona University, Tucson, August 31-Sep-ber 2, 1971. Miscellaneous Publication No. 5, U.S. Department of Agriculture, Washing-D.C., Agricultural Research Service, June 4. 386 p.

criptors: *Conferences, *Hydrology, tistical models, *Model studies, *Stochastic esses, Statistics, Mathematical studies, hematical models, Statistical methods, Rain-Runoff, Sediment transport, Data processing, ervoirs, Markov processes, Floods, Simula-analysis, Least squares method, Regression ysis, Precipitation(Atmospheric), Thun-derstorms, Streamflow, Spatial distribution, Temporal distribution, Analytical techniques.

The symposium objective was to generate cooperation and facilitate discussions between hydrologists and statisticians on the application of probabilistic and statistical methodologies to hydrologic problems. General topics covered included preparation of stochastic models of rainfall, runoff, and sediment; estimation of extreme values; and optimization of hydrologic modeling techniques. **SOME PROBLEMS IN PURE AND APPLIED STOCHASTIC HYDROLOGY,**
Toronto Univ. (Ontario). Dept. of Mechanical Engineering; and Toronto Univ. (Ontario). Inst. of Environmental Sciences and Engineering.
V. Klemes.
In: Proceedings Symposium on Statistical Hydrology, Arizona University, Tucson, August 31-September 2, 1971. Miscellaneous Publication No. 1275, p 2-15, June 1974. 8 fig, 1 tab, 19 ref.

Descriptors: *Hydrology, *Statistical models, *Runoff, *Reservoir storage, Storage, Statistics, Probability, Distribution, Frequency curves, Model studies, Reservoirs, Streamflow, Analytical techniques, Statistical methods, Stochastic processes.
Identifiers: *Distribution functions, Distribution models, Skewness.

Because the aim of pure hydrology is the understanding of the behavior of hydrologic phenomena, it is necessary that stochastic models of hydrologic processes be physically founded. Several examples were presented of how probabilistic description of the mechanism of runoff formation leads to physically justified runoff distribution models. For some applied purposes, the numerical values of parameters seem to be much more important than the forms of models, and the physical justifiability of a model seems to be irrelevant. However, a physically sound concept of a model can, at least to some extent, compensate for the inaccuracy of parameter estimates resulting from small sample sizes of available empirical data. This was illustrated by an example relating various runoff distribution models to stationary solution of the storage equation. Usefulness of stationary solution as a basis for optimization of a single storage reservoir was challenged and optimization on regional basis was advocated. (See also W75-10507) (Sims-ISWS)

**GENERAL ASPECTS OF MULTIVARIATE ANALYSIS WITH APPLICATIONS TO SOME PROBLEMS IN HYDROLOGY,**
Agricultural Research Service, Chickasha, Okla.
D. G. DeCoursey, and R. B. Deal.
In: Proceedings Symposium on Statistical Hydrology, Arizona University, Tucson, August 31-September 2, 1971. Miscellaneous Publication No. 1275, p 47-68, June 1974. 10 fig, 10 tab, 11 ref.

Descriptors: *Hydrology, *Regression analysis, *Correlation analysis, *Oklahoma, Mathematical studies, Runoff, Statistical methods, Rainfall, Data processing, Streamflow, Analytical techniques.
Identifiers: *Multivariate analysis, Discriminant analysis, Canonical regression.

Hydrologic data are collected at many sites throughout the world to provide estimates of rainfall, volumes of runoff, peak rates of flow, and other events. These events are caused by the interaction of such factors as the climatic sequences and the topographic and geologic features of the watersheds. The events themselves are also very highly related, that is, storm volumes and peak rates of flow. Therefore, the analysis of these data becomes a classic example of a multivariate problem in both the input and response characteristics. Twelve independent or causative variables and 37 dependent or hydrologic response characteristics from 90 runoff measuring sites in Oklahoma were analyzed. Conventional multiple regression, stepwise regression, and components regression were compared in the development of prediction equations. Several variations of components regression, some of which use factor analysis, were presented. A variation of the classical multiple discriminant analysis was used to find regions of similar hydrologic response. The regions for some hydrologic variables were geographically contiguous, whereas others were not. Classical canonical correlation was used to find sets of causative and response variables that are related. The concept was used as a base for showing that it is possible to develop prediction equations for various hydrologic characteristics that retain the observed intercorrelation of the hydrologic characteristics. The prediction equations were all based on the same set of independent variables. (See also W75-10507) (Sims-ISWS)

**PEDOLOGIC COVER OF THE WATERSHED OF THE PORECKA RIVER,**
Institute for Soil Research, Belgrade (Yugoslavia).
D. M. Tanasijevic.
Available from the National Technical Information Service, Springfield, Va 22161 as TT 73-56020, $4.25 in paper copy, $2.25 in microfiche. TT 73-56020, Report 1974. 62 p, 10 fig, 30 tab, 22 ref, 1 map. Translated from Pedoloski Pokrivac Sliva Porecke Reke, 1970.

Descriptors: *Soils, *Watersheds(Basins), *Pedocals, *Foreign countries, *Soil investigations, Climates, Vegetation, Data collections, Land use, Soil texture, Soil chemical properties, Soil physical properties, Brown soils, Acidic soils, Leaching, Chemical analysis, Alluvium, Productivity, Forests, Topography.
Identifiers: *Yugoslavia(Porecka River).

The Porecka River watershed comprises a narrow region in northeastern Serbia. It follows the dislocation line of the Porecka River and its tributaries, the Crnajka and Saska. The trapezoidal watershed of about 60,000 ha runs north-south and is divided into a narrow area of river terraces, stream banks, and dry gulches, and then hillocks, hummocks, hills, heights, and mountain peaks, which together with the other pedogenetic factors influenced the composition, development, and condition of the soils. Data was presented on geological composition, climate, vegetation, hydrography, and physical-chemical properties of the watershed soils. It was concluded that: (1) the pedological cover of the watershed is very heterogeneous, both in the types, sub-types, and varieties of soil, and in all other physical-chemical properties; (2) all soil formations are pre-eminently subject to processes of acidification and leaching; (3) deforested areas, especially cultivated areas, except riverside alluvial flats, are subject to erosion processes; (4) all the soils have more or less low economic-productive potential for intensive agricultural exploitation; (5) from the standpoint of exploitation, the total area of the watershed is naturally predetermined for pasture-meadow and forest production, except insignificant tracts along river courses that may be employed for crop-farming; (6) certain soils may in part be used for plantations; and (7) the primary task is to preserve developed soils by nuturing th grass-forest cover and attenuation of erosio processes. (Humphreys-ISWS)

was assumed that for fixed weather conditions, ie negative binomial distribution can be used to t the observed distribution of precipitation mounts. Varying weather conditions were then terpreted as changing the values of the parame-r of the distribution. Weather conditions vary in quasi-oscillatory manner which may be escribed by a second-order autoregressive heme (SOARS). The SOARS was used to enerate a 'Storminess' parameter, which varies rough time in the desired manner. Rate and rection of weather movement were also simu-ted to produce simultaneous values of the rameter at as many points as required. These lues were converted by functions for each point to the parameters of the negative binomial dis-bution from which point rainfall amounts were btained at each point. Use of the simulator was monstrated with data for several North Carolina ations, and the process of fitting the parameters as described. (See also W75-10507) (Sims-ISWS)

entifiers: *Cross-spectral analysis, Short-dura-n rainfall, Power spectra.

examine the relative direction of the incremen-movements of rainfall during major storms, oss-spectral analysis was performed on time se-s composed of 15-minute increments from one jor storm for three nearby stations at each of ee different watersheds. A similar analysis was rformed with data from a fourth watershed by ng a 2-year series of daily data. The daily data pear to occur randomly with time whereas the minute spectra all show considerable per-tence as measured by the large amount of vari-e that is explained by the lower frequencies. nen rainfall is associated with thunderstorm ac-ity, as in the Cherokee, Oklahoma, example, re are only small differences in rainfall charac-istics at the three stations which are separated less than one-quarter of a mile. Similar results re obtained for nonthunderstorm rainfall when gage separation is about two miles. Con-erably more experimentation has to be per-med with storms of long duration and incre-nts of various lengths in order to determine the ative movement of rainfall with time. criptors: *Rainfall, *Model studies, tworks, Statistical models, Markov processes, Stochastic processes, Probability, Mathematics, Precipitation(Atmospheric), Urban hydrology, Streamflow, Hydrology, Distribution patterns, Rainfall disposition.
Identifiers: *Hourly.

Generation of synthetic, hourly rainfall data for a network of stations was investigated because existing monthly streamflow models are inadequate for many purposes and because watershed models are available to accurately predict streamflow given the hourly rainfall on the watershed. The use of synthetic rainfall with a watershed model should give more detailed traces of synthetic streamflow than the monthly total flows obtained from currently available stochastic streamflow models. The storm model is based on the multivariate normal distribution. Persistence is incorportated in the model by including the rainfall in the current and previous hours as variables. A fractional power tranformation is used to transform the observed distribution to normal at each station. The finite probability of zero rainfall is simulated by setting all values below a predetermined cutoff to zero before computing the inverse transformation in the generating process. The estimation of the storm model parameters is complicated by the presence of zeros in the data. Nonlinear least squares is used to estimate the transformation constant as well as the mean and variance of the tranformed data at each station in each of four seasons. The covariance matrix for the transformed variables is estimated by applying the relation between bivariate normal variates to the conditional cumulative distribution function of each pair of variables. The interstorm model consists of empirically defined distributions of interstorm length for 50 period in a year to closely approximate the annual variation of interstorm characteristics. **STOCHASTIC GENERATION OF THE OCCURRENCE, PATTERN, AND LOCATION OF MAXIMUM AMOUNT OF DAILY RAINFALL,**
Agricultural Research Service, Chickasha, Okla.
A. D. Nicks.
In: Proceedings Symposium on Statistical Hydrology, Arizona University, Tucson, August 31-September 2, 1971. Miscellaneous Publication No 1275, p 154-171, June 1974. 9 fig, 10 tab, 12 ref.

Descriptors: *Rainfall, *Model studies, *Stochastic processes, *Oklahoma, Markov processes, Average, Probable maximum precipitation, Probability, Mathematics, Precipitation(Atmospheric), Networks, Distribution patterns, Rainfall disposition, Watersheds(Basins), Hydrology, Meteorology.
Identifiers: Daily.

A four-stage stochastic generation technique was used to synthesize the daily rainfall for a 1500-square-mile area in central Oklahoma. Synthetic records of up to 9 years were generated at 168 locations of an existing raingage network. Spatial patterns of rainfall for input to a hydrologic model were constructed by stochastically generating: (1) the occurrence or nonoccurrence of rainfall on each day, (2) the location of the central or maximum amount within the area, (3) the maximum amount, and (4) the pattern rainfall over the 1500-square-mile area corresponding to the central amount. Tests were presented for the representativeness and consistency of generated data including means, extremes, and frequency of occurrence in both time and spatial distribution. **COMMENTS ON THE STATISTICAL DISTRIBUTION OF RAINFALL PER PERIOD UNDER VARIOUS TRANSFORMATIONS,**
Georgia Univ., Athens. Computer Center.
P. M. Skees, and L. R. Shenton.
In: Proceedings Symposium on Statistical Hydrology, Arizona University, Tucson, August 31-September 2, 1971. Miscellaneous Publication No 1275, p 172-196, June 1974. 4 fig, 13 tab, 51 ref. US DOD IPR-19-8-8001.

Descriptors: *Rainfall, *Distribution patterns, *Frequency curves, *Frequency analysis, Statistics, Temporal distribution, Statistical methods, Precipitation(Atmospheric), Climatology, Meteorology, Storms.
Identifiers: *Gamma distributions, *Transformations, Skewness, Kurtosis, Weekly, Daily, Hourly.

The statistical distribution of rainfall amounts over relatively long periods (months, years) has received considerable attention in the literature; generally, satisfactory fits are achieved for selected locations and seasons by using well known models such as the gamma, logarithmic normal, and normal distributions. For moderate to small intervals of observations (weeks, days, hours), satisfactory distributional models are much more difficult to find, although more observations are available. Considerable skewness in rainfall distributions arises because of the relatively numerous occurrences of 'no-rain' days; if these are omitted, one source of heterogeneity is removed. Amounts of rainfall on 'wet' days can still, over short periods, be very skewed, and over 100 transformations designed to eliminate this lack of symmetry were considered. About 30 locations in the southeastern United States were studied, and periods of observations were days, hours, and 'storms' periods. In most cases, the total number of observations involved were those included in 10-year records for 1955-1964. The models tried were the gamma, censored gamma, and generalized gamma distributions. Because considerable data analysis was involved, simple criteria were used for accepting or rejecting models. For example, moment methods of estimation and sample values of the skewness and kurtosis were used to judge departures from the gamma and normal distributions. (See also W75-10507) (Sims-ISWS)

**A STOCHASTIC MODEL FOR DAILY RAINFALL DATA SYNTHESIS,**
Central and Southern Florida Flood Control District, West Palm Beach.
N. N. Khanal, and R. L. Hamrick.
In: Proceedings Symposium on Statistical Hydrology, Arizona University, Tucson, August 31-September 2, 1971. Miscellaneous Publication No 1275, p 197-210, June 1974. 4 fig, 12 tab, 10 ref, 1 append.

Descriptors: *Rainfall, *Synthesis, *Model studies, *Stochastic processes, Markov processes, Mathematical models, Climatology, Simulation analysis, Probability, Statistics, Temporal distribution, Statistical models, Statistical methods, Meteorology.
Identifiers: *Markov chain model, Daily.

A simple mathematical model was set up to synthesize daily rainfall values observed at a point. The synthesized daily rainfall values should be suitable for use in the Watershed Systems Model prepared in-house by the Flood Control District engineers. A first-order Markov Chain Model was proposed to do this. Statistical comparison was made between the historical and the synthesized daily rainfall values and they fit fairly well. **STOCHASTIC MODELS OF SPATIAL AND TEMPORAL DISTRIBUTION OF THUNDERSTORM RAINFALL,**
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
H. B. Osborn, L. J. Lane, and R. S. Kagan.

In: Proceedings Symposium on Statistical Hydrology, Arizona University, Tucson, August 31-September 2, 1971. Miscellaneous Publication No 1275, p 211-231, June 1974. 7 fig, 1 tab, 22 ref, 1 append.

Descriptors: *Rainfall, *Thunderstorms, *Model studies, *Southwest U.S., *Arizona, Statistical models, Stochastic processes, *Spatial distribution, *Temporal distribution, Water sheds(Basins), Networks, Synthesis, Simulation analysis, Mathematical models.
Identifiers: *Walnut Gulch Watershed(Ariz).

A simplified stochastic model based on air mass thunderstorm rainfall data from the 58-square-mile Walnut Gulch Experimental Watershed in southeastern Arizona is being developed at the Southwest Watershed Research Center, Tucson, Arizona. Records from the 95 raingage network on this watershed provide valuable information on air mass thunderstorm rainfall in the southwestern United States. Probability distributions are being used to model random variables - number of cells, spatial distribution of the cells, and cell center depths - of thunderstorms in a summer rainy season. A computer program produces synthetic thunderstorm rainfall based on these distributional assumptions. The synthetic data are compared, with respect to storm center depths and isohyetal map characteristics, with data from the dense raingage network on Walnut Gulch. The daily and hourly chances of occurrence of seasonal air mass thunderstorm rainfall are modeled. Efforts are being made to model the temporal distribution of rainfall from individual cells within the air mass thunderstorm. Finally, the question of model transferability to other regions and locations is tied to defining regional meteorology and local topography. (See also W75-10507) (Sims-ISWS)

**STOCHASTIC MODEL OF DAILY RAINFALL,**
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
P. Todorovic, and D. Woolhiser.
In: Proceedings Symposium on Statistical Hydrology, Arizona University, Tucson, August 31-September 2, 1971. Miscellaneous Publication No 1275, p 232-246, June 1974. 6 fig, 1 tab, 5 ref, 2 append.

Descriptors: *Rainfall, *Stochastic processes, Model studies, Markov processes, Temporal distribution, Statistics, Statistical models, Computer programs, Precipitation(Atmospheric).
Identifiers: *Markov chain model, Daily, Central limit theorem.

An application of stochastic processes for description and analysis of daily values of precipitation was presented. The total amount of precipitation S(n) during an n-day period is a discrete parameter stochastic process such that S(n) is greater than or equal to 0 and S(n + 1) is greater than or equal to S(n). The most general form of the distribution function, mathmatical expectation, and variance of S(n) were determined. The following special cases for the sequence of daily rainfall occurrences were considered: (1) sequence of independent identically distributed random variables, (2) sequence of independent random variables, and (3) markov chain. In addition, assuming that certain regularity conditions hold, it was proved that S(n) is asymptotically normal. The first passage time of S(n) and the corresponding distribution function were also considered. Numerical examples for cases 1 and 3 were presented, assuming that the daily rainfall amounts are exponentially distributed. The computer program for the Markov chain model was presented in an appendix. (See also W75-10507) (Sims-ISWS)
W75-10520

**AN EVENT-BASED STOCHASTIC MODEL OF AREAL RAINFALL AND RUNOFF,**
Arizona Univ., Tucson. Dept. of Watershed Management.
M. M. Fogel, L. Duckstein, and J. L. Sanders.
In: Proceedings Symposium on Statistical Hydrology, Arizona University, Tucson, August 31-September 2, 1971. Miscellaneous Publicantion No 1275, p 247-261, June 1974. 8 fig, 1 tab, 16 ref. OWRT A-020-ARIZ(10).

Descriptors: *Rainfall, *Runoff, *Model studies, *Stochastic processes, Areal, Statistical models, Probability, Frequency curves, Rainfall-runoff relationships, Precipitation(Atmospheric), Meteorology, Hydrology.
Identifiers: Point rainfall.

A stochastic model of rainfall was developed to obtain runoff sequences on watersheds where the maximum events are most likely to be the result of thunderstorms. Runoff-producing rainfall events for a watershed were defined as a function of minimum levels of point measurements. The causal factors of a point measurement, given the occurrence of an event over a watershed, were the magnitude, location, and pattern of that areal event. It was found that the probability distribution function of point rainfall is geometric. Random variables representing precipitation at several points were then convoluted to yield mean areal values of rainfall whose distribution is negative binomial. Chicago and New Orleans data seem to validate the model developed in Tucson. A table describing seasonal rainfall combinations was used to generate possible annual sets of events. Corresponding likely sets of runoff amounts were then obtained by using both a simple linear rainfall-runoff relationship and the Soil Conservation Service formula for estimating runoff. A study of the frequency distribution of annual number and duration of runoff events with the use of an independent set of data provided a further validation of the proposed model. **STATISTICAL MODEL OF SHORT-DURATION PRECIPITATION EVENTS,**
Iowa State Univ., Ames. Dept. of Civil Engineering.
T. A. Austin, and B. J. Claborn.
In: Proceedings Symposium on Statistical Hydrology, Arizona University, Tucson, August 31-September 2, 1971. Miscellaneous Publication No 1275, p 356-365, June 1974. 4 fig, 7 tab, 7 ref.

Descriptors: *Precipitation(Atmospheric), *Mathematical models, *Rainfall, *Texas, Runoff, Rainfall-runoff relationships, Monte Carlo method, Simulation analysis, Model studies, Storms, Meteorology, Climatology, Hydrology.
Identifiers: *Lubbock(Tex), Short-duration precipitation.

A mathematical model of short-duration precipitation events was presented. The model assumed these short-duration events were random in nature and could be described by a set of stationary probability distribution functions. The model described the storm depth, duration, and the time interval since the occurrence of the last storm event. In addition, a procedure for distributing the rainfall depth during the storm was proposed. The model is useful in providing stochastic inputs to rainfall-runoff models in order to evaluate the runoff from a variety of storm and antecedent conditions. Data from Lubbock, Texas were used to calibrate and verify the model. The means and standard deviations of the generated sequences were statistically indistinguishable from the means and standard deviation of the historical data. (See also W75-10507) (Sims-ISWS)

e differences between polar deserts, (defined as cier-free terrestrial areas where mean annual ecipitation is less than 25 cm and the mean temrature for the warmest month of the year is less an 10C.) and temperate-tropic deserts are cussed in relation to the differences in omorphic processes. Differences are (1) cold rsus hot environments, (2) precipitation in solid her than liquid form, (3) precipitation concented in annual spring runoff in the cold desert, d (4) most soil moisture in the polar desert is in solid state as ice. The limitation of man's acities in polar desert areas is attributed to the esence of permafrost. This layer of permafrost, increase in thickness annually. Its distribution affected by snow, vegetation cover, topogphy, and bodies of water. The content of ground in permafrost greatly affects human life in the rth and provides evidence concerning past clites beyond the range possible by geothermal culations. The causes and formation of ice dges are described, some wedges dated by diocarbon analysis appear to be from 3,000 to 000 years old. Geomorphic features related to rmafrost include soil flowage, surface microre- patterns which cause beaded drainage patns, and uneven land formation. Features comn to polar and temperate-tropic deserts include sand dunes, ventifacts and taffoni. Modern man's adaptation attempts to accommodate polar desert conditions are discussed, including the difficulties encountered in construction engineering. (Michael-Arizona)

The phenomenon of the hydrologic regimen in the Arctic deserts with permanent freshwater lakes and large well-developed river basins but with precipitation less than 6 cm annually is discussed. In the High Arctic the major sources for runoff are melt of glacier ice and melt of ground ice. Lag runoff from accumulation of winter snow is a major source of water in small stream basins that are independent of glaciers. Large streams in the northern cold deserts are supplied by runoff from melting glaciers. During the twentieth century, this source of water has been operating at a deficit, with more runoff than accumulation, resulting in some dramatic changes in glaciers and in the margins of ice sheets. Polar lakes are classified in three divisions; lakes with large quantities of material suspended in water, frequently supporting perennial ice; lakes containing clear water, most of which are fed by snow melt and are clear of ice in July and August and which, in areas where aridity is maximum, have a high salt content which increases with evaporation and proximity to marine salt terraces; and shallow lakes occupying elongated basins where erosion occurs during melt periods due to wind-generated wave and current action. Ice free land within the cold desert of Antarctica occurs in relatively small regions. Ablation is high in these areas, precipitation amounting to 6 to 12 cm annually, most in the form of snow. Most lakes in the dry valleys of this region are saline. (Michael-Arizona)

SOILS OF THE HIGH ARCTIC LANDSCAPES,
Rutgers - the State Univ., New Brunswick, N.J.
J. C. F. Tedrow.
In: Polar Deserts and Modern Man, T. L. Smiley and J. H. Zumberge, eds. University of Arizona Press, Tucson, p 63-69, 1974. 11 fig, 1 tab, 36 ref.

Descriptors: *Polar regions, *Soils, *Soil classification, *Soil physical properties, *Antarctic, *Arctic, Sierozems, Tundra, Streams, Sands, Silts, Saline soils, Frozen soils, Frost action, Erosion, Soil erosion, Thawing, Meltwater, Bogs, Floodplain, Solifluction.
Identifiers: Subpolar, Desert pavement, Hummocky ground, Rockland.

Major genetic soils within the polar zone are discussed. Polar desert soils have a desert pavement surface with free, almost xeric drainage. This soil is usually neutral but commonly alkaline in reaction. Hummocky-ground soils, influenced in size and shape by erosion, contain a mixture of humic substances and organic material, and frequently are mineral-stained. Polar desert-tundra interjacence soils have a superabundance of moisture during the spring and early summer thaw period. During the dry season, the soils become hard, with salts efflorescing on the surface. Tundra soils are usually mildly acid, but sometimes alkaline when the low-lying tundra soils dry out. Soil distribution is influenced by textural composition; loams and silts are present in low-lying areas; and rockland, frost shattered areas, rocky talus slopes, floodplains and gravel bars are present throughout the High Arctic. On steep slopes, solifluction processes have obliterated or deformed many of the genetic soil features. Antarctic soils are classified as (1) ahumic soils, (2) evaporite soils, (3) protoranker, and (4) ornithogenic. (Michael-Arizona)

APPLICATION OF LOW-LATITUDE MICROBIAL ECOLOGY TO HIGH-LATITUDE DESERTS,
Jet Propulsion Lab., Pasadena, Calif.
R. E. Cameron.
In: Polar Deserts and Modern Man, T. L. Smiley and J. H. Zumberge, eds., University of Arizona Press, Tucson, p 71-90, 1974. 21 fig, 8 tab, 65 ref.

Descriptors: *Polar regions, *Soil microbiology, Ecology, Soil texture, Chemical properties, Physical properties, Chemical reactions, Latitudinal studies, Antarctic, Laboratory analyses, Environment, Biology, Chemical analysis.

Field techniques and laboratory analyses in the study of desert microbial ecology are described. Environmental and ecological features, as well as biotic factors and previous data collected are important in the selection of sampling sites. Aerobiological monitoring is used to make comparisons between distributions, abundances, and kinds of aerial propagules and soil microbiota. Methods to determine soil physical and chemical properties are described and results obtained on world arid-zone soils are presented. Properties described include texture, color, moisture content, redox potential and pH, electrical conductivity, cation and anion content, organic carbon content, organic nitrogen, cation exchange capacity, buffer capacity, moisture constants and thermoluminescence. Lower cation exchange and buffer capacity exist in the polar desert soils. Electrical conductivity varied depending upon the quantity and nature of salts in the soil. Abundances and types of microbes in arid-zone soils and their metabolic activity are described. Aerobic and microaerophilic bacteria are in highest abundance in desert regions, but the Antarctic polar desert has the fewest recoverable numbers of microorganisms. The Antarctic desert can be used to study soil microbial ecology at its least complex level in terms of gradients of the physical and chemical environment of the soil, terrain and microclimate at increasing latitude and altitude. Gradients range from uninhabitable to increasingly favorable environments; these conditions are summarized. The hygrothermal regime is the most important factor. (Garrettson-Arizona)

PROCESSES AND COSTS IMPOSED BY ENVIRONMENTAL STRESS,
Alaska Univ., College. Inst. of Social, Economic, and Government Research.
A. R. Tussing.
In: Polar Deserts and Modern Man, T. L. Smiley and J. H. Zumberge, eds., University of Arizona Press, Tucson, p 105-113, 1974. 6 tab, 51 ref.

Descriptors: *Polar regions, *Temperatures, *Ice fog, *Ice, *Freezing, Biology, Productivity, Economics, Mining, Arctic, Costs, Transportation, Pipeline, Oil, Gas, Fossil fuels, Alaska.

The stress imposed by man's works upon the polar environment and the stress imposed by the environment upon human activity are reported. Biotic productivity on land and in both fresh and salt water tends to be low causing the plant and animal resource potential to be of little significance commercially. The greatest cost for economic development has been expenditures for

construction, mineral exploration, transportation, and human habitation. The polar region is increasingly seen as a natural asset to non-Arctic man, and alteration of its wilderness status as constituting a cost to humanity. The cost of living index indicates rental costs for a moderate income family in Anchorage were 213 percent of the U.S. urban average. The formation of 'ice-fog' at temperatures below -30 deg C. forces man to consume more primary energy and invest in greater amounts of heating materials. Another powerful influence on costs is the fact that polar regions are being developed with equipment, building methods, and materials largely developed for radically different environments. Man-hour physical productivity is widely reported to be lower in Arctic and Sub-Arctic environments. The loss of man's effectiveness under conditions of dry cold with no wind was negligible down to about -18 deg C; performance fell to nearly zero at about -34 deg C. (Garrettson-Arizona)

**REVIEW OF DEVELOPMENT OF ARCTIC RESOURCES,**
Arctic Inst. of North America, Montreal (Quebec).
J. C. Reed.
In: Polar Deserts and Modern Man, T. L. Smiley, and J. H. Zumberge, eds., University of Arizona Press, Tucson, p 115-118, 1974. 10 ref.

Descriptors: *Arctic, *Resources, *Resources allocation, *Resources development, Oil, Gas, Clays, Sands, Gravels, Gold, Transportation, Communication.
Identifiers: *Bering Sea.

The historical development of Arctic resources is described. Resources are listed as renewable, nonrenewable, and nonexpendable. Three major factors inhibiting Arctic development are (1) lack of adequate transportation systems, (2) limitations of communication systems, and (3) inadequacies of a supply of reliable labor. Renewable resources are the plants and animals from the land and sea. Nonrenewable resources are (1) non-metals like sand, gravel, clay, fluorspar, and crushed stone, (2) the metallic ores, (3) coal, and (4) oil and gas. Examples of nonexpendable resources are scenery, open tundra, midnight sun, the ice-flecked Arctic ocean, and sport fishing. (Garrettson-Arizona)

**RESOURCE DEVELOPMENT IN CANADA'S HIGH ARCTIC,**
G. Jacobsen.
In: Polar Deserts and Modern Man, T. L. Smiley and J. H. Zumberge, eds., University of Arizona Press, Tucson, p 119-121, 1974.

Descriptors: *Canada, *Arctic, *Pollutants, *Resources development, Wildlife, Oil, Natural gas, Oil spills, Fossil fuel, Domestic wastes, Recreation, Mining, Pipelines.
Identifiers: Renewable resources, Nonrenewable resources.

The development of renewable and nonrenewable resources in the high polar regions of Canada is discussed. The only renewable resource which is exported is furs. Another renewable resource is the enormous empty space which will be a great asset for recreation and leisure activities. Nonrenewable resources under exploration are oil, gas, and minerals. The Canadian High Arctic will become a major supplier of fossil fuel energy. Major factors thought to affect rapid development of resources are lack of ambition due to a highly taxed welfare society, and changes in social structure and way of living. A serious environmental hazard is pollution resulting from sewage and garbage disposal from permanent Arctic settlements. Another pollution hazard is oil spills resulting from tanker damage and oil pipeline breaks. (Garrettson-Arizona)

**LARGE SCALE LABORATORY DIRECT SHEAR TESTS ON ICE,**
Alberta Univ., Edmonton. Dept. of Civil Engineering.
W. D. Roggensack.
Canadian Geotechnical Journal, Vol 12, No 2, p 169-178, May 1975. 9 fig, 2 tab, 10 ref.

Descriptors: *Ice, *Lake ice, *Shear strength, Mechanical properties, Strength, Shear, Strength of materials, On-site tests, On-site investigations, Equipment, Testing procedures, Failure(Mechanics), Laboratory equipment, Laboratory tests, Civil engineering, Mechanical engineering.

The results of a series of large-scale direct shear tests performed on lake ice were presented. Test specimens were oriented with the principal stresses acting in the plane of the ice sheet, approximately normal to the long axes of the columnar crystals. Sample dimensions were large in comparison with mean crystal diameter, reducing the possibility of deviations introduced by size effects. Although a number of assumptions were made concerning stress conditions at failure, results for uniform, artificially 'seeded' test pond ice indicated a failure mechanism that was frictional and consistent with triaxial test data reported elsewhere. Post-peak shear resulted in the formation of a distinct failure zone that also displayed a frictional response. The direct shear test described is robust and simple, does not require elaborate sample preparation, and may present an alternative method of strength determination for ice mechanics problems where the shear box configuration duplicates field stress conditions and constraints. **SNOW CREEP: ITS ENGINEERING PROBLEMS AND SOME TECHNIQUES AND RESULTS OF ITS INVESTIGATION,**
British Columbia Univ., Vancouver. Dept. of Geological Sciences.
W. H. Mathews, and J. R. Mackay.
Canadian Geotechnical Journal, Vol 12, No 2, p 187-198, May 1975. 9 fig, 9 ref.

Descriptors: *Snowpacks, Movement, *Pressure, *Canada, Snow, Mechanical properties, Mountains, Slopes, Density stratification, Surveys, Elastic deformation, On-site investigations, Equipment, Engineering.
Identifiers: *Snow creep.

Aspects of the slow creep of the snow pack on mountain slopes in southern British Columbia were investigated. Studied particularly were (1) the rate of slip of the basal layer of snow on its substratum, (2) the pressures applied by the creeping snow pack on some stationary obstacles, and (3) the regional and the year-to-year variations of such pressures. Simple, relatively inexpensive equipment and methods were developed to explore these problems. These indicate, for example, basal creep velocities up to 90 cm per winter season on very steep slopes, and pressures in the order of 0.5 kg/sq cm under extreme conditions. These studies led to guidelines for future site investigations of areas subject to snow creep. (Sims-ISWS)

tifiers: *Rocky Mountain Trench(British mbia), Till fabric, Till composition.

Wisconsinan glacier-flow patterns and till sis in the southern Rocky Mountain Trench, sh Columbia, were determined by studying al landforms, till fabric, and till composition. ajor shift in the pattern of glacier flow oc- d near the end of glaciation; tributary glaciers scent with the trunk glacier in the Trench ded, and side valleys were invaded by the glacier. Final recession of the trunk glacier rred with no major halts and without stagna- of the terminus. Till associated with drumlins e Trench accumulated by lodgement of parti- due to subglacial pressure melting against a r substratum. Fabric results from the lower of the younger till sheet suggest either com- patterns of ice flow similar to those at junc- of many modern valley glaciers, or mass ment of supraglacial till associated with an stadial interval within the late Wisconsinan ation. Compositional analysis is relatively in- tive as an indicator of short-lived ice-flow uations in the southern Trench. Rather, till position reflects the dominant pattern of ice during glaciation: a south- to south-east flow- unk glacier augmented by coalescent tributa- aciers. Most pebbles and fine-grained sand in ills of the Trench are of local origin. Local ituents decrease in relative amounts away the mouths of tributary valleys where they erived. These decreasing gradients result lar- from progressive deposition and dilution. -ISWS)

Descriptors: *Avalanche, Snow management, Warning systems, Communications, Radio communication systems, Networks.
Identifiers: Avalanche information dissemination.

Snow avalanche warnings are an effective method of alerting the public to unusually dangerous avalanche conditions. An effective warning message conveys a sense of urgency, and should have an official and authoritative source. The message must be simple, clear, and concise. Warnings are transmitted through the National Weather Service's communications network to the media and public. Timely release of bulletins elicits good media coverage. (Forest Service)

Identifiers: *Snow fences, Snow control, Snow protection, Blowing snow.

New engineering criteria have been used to design a snow control system that is unusually effective in preventing drifts, improving visibility, and reducing formation of road ice. This paper describes these criteria and the research results on which they are based. A method for estimating the amount of blowing snow is used to determine the height and number of rows of fencing required at each site. Design and capacity of the new Wyoming Highway Department standard-plan fence is given. Tall (3.8m) fences have been used in preference to shorter ones because experience has shown taller structures to be more efficient in trapping snow and to have a much lower construction cost per unit of storage. Terrain can be used to greatly increase the capacity of snow fences -- capacity is increased about 15-20% for each 0.017 rad of downslope behind a fence and about 15% for each 0.017 rad of upslope in the approach zone. Because wind sweeping around fences ends reduces storage capacity significantly over a distance from the ends of 12 times the height, length of fences should be at least 30 times their height, and staggered barriers should be overlapped at least 8 times their height. (Forest Service)

Identifiers: *Blowing snow, Snow accumulation, Snow control, Snow fences.

Complexity of the physical processes does not permit the transport and evaporation of windblown snow to be estimated from a purely theoretical analysis. This paper describes a simplified conceptual model based on the maximum distance that a particle can travel before complete evaporation, and derived from consideration of the consequences of a non-uniform particle size distribution. Model predictions agree well with snow accumulations measured at numerous sites in southeast Wyoming over several years. Results indicate a significant portion of the winter's precipitation is lost to in-transit evaporation on sites where snowfall is relocated by wind. An example is given of how this model can be used to assess effects of land management practices on the transport and evaporation of blowing snow. (Forest Service)

**EFFECTIVENESS OF PRECIPITATION IN A MOUNTAIN MEADOW,**
Agricultural Research Service, Fort Collins, Colo.
E. G. Kruse, and H. R. Haise.
In: Agricultural and Urban Considerations In Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 627-646, 1974. 9 fig, 3 tab.

Descriptors: *Evapotranspiration, *Grasses, *Precipitation(Atmospheric), *Irrigation, *Colorado, Rainfall, Runoff, Evaporimeters, Humidity, Solar radiation, Evaporation pans, Storms, Water table, Temperature, Mountains, Wind velocity, Water utilization.
Identifiers: *Meadow grasses, *Gunnison(Col), Meadow irrigation, Sunken tanks, ET tanks, Precipitation effectiveness.

Evapotranspiration was measured during three seasons at each of two locations in high mountain meadows in Colorado. Sunken ET tanks with native vegetation and with the water table maintained near the surface were used to obtain the measurements. Class A pan evaporation, total solar radiation, temperature, humidity, and wind speed were measured daily. Evapotranspiration varied from 59.6 to 70.5 cm (23.5 to 27.8 inches). Measured ET averaged about 82% of evaporation. During two seasons, the effectiveness of precipitation in reducing the demand for irrigation water was determined by sheltering two of the ET tanks during storms while the other tanks were left unprotected. Small storms, less than 0.50 cm (0.20 inch), averaged about 50% effective in reducing irrigation water demand. The effectiveness of all rainfall received during the growing season was 75%. Descriptors: *Simulation analysis, *Streamflow, *Model studies, *Rivers, *Nevada, Runoff, Stream gages, Statistical models, Mathematical models, Analytical techniques, Monthly, Temporal distribution, Frequency, Hydrology.

The problems associated with conducting sequential simulation studies of monthly streamflow were discussed. Focus was on a configuration of six gaging stations in the Truckee River System. The concepts of simulation were structured in such a manner that both the serial and cross correlations of the station-to-station dependence was preserved. The results were investigated by comparing the statistical properties of the simulated sequences and the historic flow inputs. Some of these properties include mean, standard deviation, and skewness; correlograms; and frequency distributions. Lack of meaningful agreement in the statistics of historic and simulated sequences for Tahoe inflow, particularly for the low flow regime, is attributable to the use of a blanket 'Log-Pearson Type III distribution' for all stations, for all seasons, and for each month. Tahoe inflow is predominantly a consequence of the precipitation on the large body of water. Lag time and the frequency distribution of precipitation and streamflow are distinctly different. Consequently, postulating the same parent distribution has led to
crepancies. Smoothing and truncating the
coefficients as advocated by the method us
partially responsible for the lack of agree
between historic and simulated sequences.

roblem of determining an adequate model to te streamflow volumes for use in a reservoir etermination study was examined from a s analysis viewpoint. A brief history of ru- odels used in reservoir studies was given to te how available data and technology have ced the degree of model sophistication em- . A simple annual Markov model was used ustrate problems associated with the nics of generation, particularly with respect adequacy of Monte Carlo sampling, to en- rocedural accuracy. The sensitivity of reser- torage requirements to slight changes in parameter values illustrates parameter where even the simplest stochastic runoff s are critically limited by input data uncer- s. For such cases, the end product of an ion study can be extremely uncertain. There is a limit to the advances that can be made ngineering hydrology by considering hed runoff as a stochastic process. When variability is large, more realistic stream- olume models can be constructed by model- cipitation as a stochastic process and rout- chastically generated precipitation through ministic watershed model thus more accu- reflecting the complex interactions that within the watershed. ers: Markov chain models.

l of certain streamflows was formulated in f a random process which is a function of a Markov process with stationary transition probability. This process was approximated by a higher order Markov process with stationary transition probabilities. By using streamflow data from measuring stations in Arizona, the model was applied to study questions about changes in the frequency of moderately long wet and dry periods, prediction of streamflow behavior using only past streamflow records, long range trends of streamflow, and other problems. Some questions about approximating the model by higher order Markov processes were raised but not satisfactorily answered. (See als W75-10507) (Sims-ISWS)

Identifiers: *Data extension, *Sabin River(Tex), Fill-in techniques.

Basic to all water resource planning, design, and operation studies is the development of an acceptable hydrologic and meteorologic data base. Because most of the available historical records either have gaps located within an otherwise continuous set of observations or long periods of missing observations prior to gage installation or subsequent to gage removal, the problem of how to reconstitute the missing observations over the appropriate temporal and spatial horizon and then generate other equally likely stochastic data sets is one of considerable importance. Several methodologies and associated computer programs exist for filling noncontinuous multistation data sets. The successes and failures realized in striving to use one of these techniques, the Monthly Streamflow Simulation Program (MOSS), in eastern Texas were discussed. Specific modifications which were made to MOSS, in order to develop acceptable filled-in data bases, were also presented; and usage procedures were suggested for developing filled-in and stochastic data bases in eastern Texas. **RECURRENCE INTERVALS OF ANNUAL MINIMUM STREAMFLOWS,**
Keystone Junior Coll., LaPlume, Pa. Dept. of Mathematics.
E. S. Joseph.
In: Proceedings Symposium on Statistical Hydrology, Arizona University, Tucson, August 31-September 2, 1971. Miscellaneous Publication No 1275, p 366-370, June 1974. 1 tab, 7 ref.

Descriptors: *Low flow, *Droughts, *Model studies, *Mathematical models, *Missouri, Flow, *Streamflow, Probability, Frequency, Frequency curves, Hydrology.
Identifiers: *Return periods.

Prerequisite to comprehensive planning for development of water resources in a river basin is the knowledge of the low-flow characteristics of streams in the basin. Information essential to planned development of water resources includes the magnitude and frequency of annual droughts. Such information concerning probable extremes can be obtained by a frequency analysis, using past records of the watershed. Owing to the variation of streamflow minimums, the analysis has to be necessarily done in a probabilistic framework. An analytical approach for estimating the magnitudes of annual droughts in a stream corresponding to specified return periods was proposed. The method was illustrated by a frequency analysis performed on the data of 26 storms in Missouri. The 10-, 50-, and 100-year droughts based on likelihood estimates were presented for these stations. With the help of a computer program, this method yielded results readily and overcame the disadvantages inherent in graphical procedures. (See also W75-10507) (Sims-ISWS)

Identifiers: *Curve fitting, *Mixed distributions, Log-Pearson type III distribution.

Samples of many hydrologic variables - such as floods, runoffs, and droughts - do not conform to any one standard distribution. The distributions obtained from the samples were considered as mixed distributions, each of which can be decomposed into two or more components. An objective methodology was developed for obtaining the parameter estimates of two component distributions constituting a mixed distribution. This methodology generated first-order estimates of means and variances of the component distributions and then refined them using an iteration procedure that minimized the sum of squared differences between the observed and fitted normal deviates. A mixture of only two normal distributions was shown to simulate satisfactorily the observed annual floods and monthly streamflows. The magnitudes of mean and variance obtained from the fitted mixed distributions were in accord with the corresponding estimates obtained from the observed flood distributions. In the case of monthly streamflow, the parameters of the component distributions possessed annual cycles. (See also W75-10507) (Sims-ISWS)

**DAILY TEMPERATURE AND SALINITY OF SURFACE WATER OF PATUXENT RIVER AT SOLOMONS, MARYLAND, BASED ON 30 YEARS OF RECORDS (1938-1967),**
Maryland Univ., Solomons. Chesapeake Biological Lab.
D. E. Ritchie, Jr., and J. B. Genys.
Chesapeake Science, Vol 16, No 2, p 127-133, June 1975. 2 tab, 1 ref.

Descriptors: *Salinity, *Temperature, *Water quality, *Maryland, Chemical properties, Water properties, Saline water, Sea water, Physical properties, Thermal properties, Tides, Tidal waters, Surface waters, Rivers, Density, Statistical methods, On-site data collections.
Identifiers: Daily, *Patuxent River(Md), Bristol thermograph, Standard deviation, Minimum, Maximum, Coefficient of variation.

Thirty years of daily temperature and salinity records of Patuxent River surface water at Solomons, Maryland were reported. The 30-yr average value, standard deviation, minimum, maximum, and coefficient of variation for each calendar day were calculated from the records of daily noontime observations. A fourth degree polynomial regression can be used to predict the water temperature (C) for any given day (d) of the year where February 1 is counted as day 32: C = 11 - 0.417d + 0.00624d to the 2nd power - 0.0000245d to the 3rd power + 0.0000000285d to the 4th power. The 'warm-up' period lasts 6 months from February 1 to August 1; temperature ranges from 2.4 to 27.5C with standard deviations of 0.9 to 2.1C. The 'cool-down' period is completed 6 months later. The lowest reading (-0.8C) occurred on February 10 and 11 while the highest (30C) occurred on July 31, August 1 and 3. There was no correlation between salinity and temperature. The highest mean salinity (16.0 to 16.8 ppt) occurred during October 17 to December 16, with November 19 and 20 having the highest value. The lowest mean salinity (10.2-10.9 ppt) occurred during April 15 to June 10, with lowest value of 10.2 ppt on April 27, 30, and May 1. There were 187 days between dates of mean highest and mean lowest salinity. The lowest individual salinity recorded was 5.4 ppt on June 7, and the highest was 20.9 ppt on December 12. Coincidently, 188 days separate these day-of-the-year occurrences. (Henley-ISWS)

**LOW-FLOW CHARACTERISTICS OF MISSISSIPPI STREAMS,**
Geological Survey, Jackson, Miss.
E. J. Tharpe.
Mississippi Board of Water Commissioners, Jackson, Bulletin 75-1, 1975. 60 p, 5 fig, 2 tab, 28 ref.

Descriptors: *Low flow, *Streamflow, *Low flow frequency, *Hydrologic data, *Mississippi, Streamflow forecasting, Correlation analysis, Water yield, Discharge(Water), Gaging stations, Data collections, Runoff, Watershed management, Regulated flow.
Identifiers: 7-day average flows, 10-year recurrence interval.

Low-flow data for 443 sites on streams in Mississippi provide the basis for calculation of minimum 7-day average flows, and annual 7-day average low flows with 2-and 10-year recurrence intervals. These flow characteristics, particularly the annual 7-day average low flows with a 10-year recurrence interval, are used along with minimum observed discharges in determining the availability of flow for water supply and waste assimilation and in administering water laws and regulations. Low-flow characteristics of long-term stations were computed by a Log-Pearson Type III probability analysis of available data. For partial-record and short-term continuous-record sites these characteristics were defined from a correlation based upon flows concurrently observed at the site and at a nearby long-term station. At ungaged sites, low-flow characteristics may be approximated either by interpolation between gaged sites or from a map showing areas of near-uniform low-flow yields. These areas which are delineated on the basis of geologic and hydrologic similarities, have yields ranging from 0 to more than 0.5 cubic foot per second per square mile. (Woodard-USGS)

Water and Wastes Engineering, Vol 11, No 1, 26, 35-36, Jan, 1974, 15 fig, 2 tab, 16 ref, appe

Descriptors: *Rainfall-runoff relation *Rational formula, *Runoff forecasting, *U drainage, Antecedent precipitation, Urban r Design storm, Duration curves, Flow sy Hydrographs, Rainfall intensity, Time series ysis, Infiltration, Time of concentration.
Identifiers: Montreal Urban Community(Can

The Montreal Urban Community, including 2 nicipalities, wanted runoff hydrographs bas storm patterns for its runoff system design widely used rational formula which assume stant rainfall intensity and runoff through storm does not give actual storm runoff pa needed in designing facilities, even with co additional computer programs. A sim method, based on precipitation statistics a dated intensity-duration curves, permits matical simulation of design storms of v frequencies. Both antecedent rainfall (befo noff begins) and the percentage of impervio faces are considered to calculate the time the storm when rainfall exceeds infiltration noff begins. An excess rainfall curve is com A single coefficient which varies with time to reflect all losses such as depression stora surface detention. From the excess rainfall runoff hydrograph is computed. Data from measurement program and the inflow fro sub-basin are used to route the design storm through sewage collectors to obtain the system outflow hydrograph. For each given frequency and various percentages of impe surface, the hydrograph peaks, concen through the sewer system, give a chart to mine sewer facility size. (Herr-North Caroli

tifiers: *Triassic rocks(Md).

rocks of the Newark Group of Late Triassic n Maryland occur in the northern and western of the Frederick Valley in Frederick and Car- Counties and in the western part of Mont- ery County. These consolidated bedrock ers consist of a complex interbedded ence of arkosic sandstone, shale, siltstone, quartz-pebble and limestone-pebble con- erate. Water is stored and transmitted gh joints, faults, and bedding-plane partings e rock and, to a limited extent, in interstitial space in the weathered rock mantle; the primary pore space in the rock has been almost eliminated by compaction and cementation. The Triassic-rock aquifers are a reliable source of water for domestic, farm, and small commercial use; only 6.5 percent of the wells inventoried yield less than 3 gallons per minute. Groundwater supplies sufficient for most commercial and light industrial use can be developed under favorable hydrogeologic conditions. Wells at least 300 or 400 feet deep return maximum water yields. The water in the Triassic-rock aquifers is generally of good chemical quality. (Woodard-USGS)

**A PREDICTIVE COMPUTER MODEL OF THE LOWER CRETACEOUS AQUIFER, FRANKLIN AREA, SOUTHEASTERN VIRGINIA,**
Geological Survey, Richmond, Va.
O. J. Cosner.
Available from NTIS, Springfield, Va 22161 as PB-243 410, $4.25 printed copy, $2.25 in microfiche. Water-Resources Investigations 51-74, April 1975. 62 p, 33 fig, 3 tab, 9 ref, 2 append.

Descriptors: *Aquifer characteristics, *Hydrogeology, *Computer models, *Water level fluctuations, *Virginia, Atlantic Coastal Plain, Hydrologic data, Groundwater movement, Digital computers, Systems analysis, Hydrology, Pumping, Water wells, Water yield, Groundwater recharge, Transmissivity, Groundwater resources, Storage coefficient, Forecasting, Model studies.
Identifiers: *Franklin area(Va), Lower Cretaceous aquifer.

The Lower Cretaceous aquifer in southeastern Virginia was simulated by a finite-difference digital model. The area modeled is centered at Franklin, Va. The aquifer is about 600 ft thick there, and is estimated to be 2,000 ft thick 35 miles to the east. The aquifer consists of alternating permeable and semipermeable sand, gravel, silt and claybeds, and it is overlain by a semipermeable confining bed. Transmissivity is about 19,000 cu ft/day/ft at Franklin, decreasing to the west and increasing to the east. A prepumping water-level surface was developed by modeling. The use of a modeling factor, transmissivity over vertical permeability of the confining bed, is described. Simulation runs to 1941, 1970, 1972 are in good agreement with historical data. Predictive runs show that if pumpage continues to increase, dewatering will occur at Franklin. If pumpage does not increase, additional drawdown will be small. (Woodard-USGS)

**GROUND-WATER CONDITIONS IN UTAH, SPRING OF 1975,**
Geological Survey, Salt Lake City, Utah.
J. H. Eychaner.
Utah Division of Water Resources, Salt Lake City, Cooperative Investigations Report No 14. 1975. 26 p, 37 fig, 2 tab, 13 ref.

Descriptors: *Groundwater resources, *Water levels, *Basic data collections, *Utah, Hydrologic data, Hydrographs, Maps, Water wells, Withdrawal, Water utilization, Irrigation, Surface-groundwater relationships, Water quality, Dissolved solids, Precipitation(Atmospheric), Water level fluctuations.
Identifiers: *Groundwater development.

This report is the twelfth in a series of annual reports that describe groundwater conditions in Utah. The report includes individual discussions of the most important areas of groundwater withdrawal in the State for the calendar year 1974. Water-level fluctuations, however, are described for the period spring 1974 to spring 1975. The estimated total withdrawal from wells in 1974 was about 879,000 acre-ft which was about 165,000 acre-ft more than in 1973 and 195,000 acre-ft greater than the average annual withdrawal for the period 1964-73. Both the increase over 1973 and the increase over the 10-year average were due primarily to changes in withdrawals for irrigation. Estimated total withdrawals for irrigation in 1974 were about 611,000 acre-ft, which was about 27% more than the 480,000 acre-ft withdrawn in 1973. Changes in groundwater levels from spring 1974 to spring 1975 reflected the decreased availability of surface water and the increase in groundwater withdrawals. Water levels fell in most major groundwater basins in the State. Pavant Valley, in central Utah, was the only major groundwater basin in which water levels were higher in March 1975 than in March 1974. (Woodard-USGS)

## 2G. Water In Soils

**OPERATIONAL VALUE OF WEATHER INFORMATION IN RELATION TO SOIL MANAGEMENT CHARACTERISTICS,**
Purdue Univ., Lafayette, Ind. Agricultural Experiment Station.
R. E. Ewalt, D. Wiersma, and W. L. Miller.
Agron J, Vol 65, No 3, p 437-439, 1973. Illus.
Identifiers: Forecasting, Management, Moisture content, *Operations, Precipitation(Atmospheric), *Soil management, *Weather information, Soil moisture.

Possible relationships between farm operator valuations of forecasts, soil management characteristics, and the accuracy of precipitation forecasts were studied. Two-thirds of the 145 interviewed farm operators used both precipitation and field conditions forecasts in planning and conducting major field operations. These operators

valued both types of forecasts at higher levels of usefulness than did the remaining 1/3, who used only precipitation forecasts. The usefulness of precipitation forecasts and field conditions forecasts increased with increasing water-holding capacity and susceptibility of soils to physical problems such as cloddiness, tillage plans and surface sealing. Farm operators who used both types of forecasts valued them at approximately the same levels of usefullness in relation to major field operations conducted during the crop season. Highest values were associated with field operations that are conducted during the spring months. Precipitation forecasts were more useful than field conditions forecasts in making general management decisions. No relationship was found between the error rates of precipitation forecasts and farm operator evaluation of their usefulness.--Copyright 1973, Biological Abstracts, Inc.

Limnology and Oceanography, Vol 20, No 3, p 323-337, May 1975. 11 fig, 1 tab, 31 ref. NOAA Grant 2-35281.

Descriptors: *Model studies, *Lake Ontario, *Circulation, *Hydraulic models, Boundaries(Surfaces), Gravity, Shear, Seiches, Winds, Drifting(Aquatic), Thermal stratification, Flow, Froude number, Currents(Water), Stratification, Stress, Laboratory tests.
Identifiers: Earth rotation, Hydraulic throughflow, Seiche decay, Rossby number.

A distorted hydraulic model of Lake Ontario was constructed and operated in a rotating laboratory. The model study included the effects of the earth's rotation, gravity, and hydraulic through-flow. Boundary shear in the model was checked against theoretical predictions of seiche decay. Wind shear was adjusted to achieve appropriately scaled drift velocities in the model. Observed surface and subsurface circulation patterns were presented for a homogeneous and stratified lake model with and without a westerly wind. (Roberts-ISWS)

ANALYSIS OF THE MECHANICS OF
RD CELL MOTION,
s A and M Univ., College Station. Bioen-
ring Program.
. Demichele, and J. H. Peter Sharpe.
nal of Theoretical Biology, Vol 41, No 1, p 77-
973. Illus.

riptors: *Stomata, *Cytological studies,
ermis, *Plant morphology.
ifiers: *Guard cell motion, Turgor pressure.

A mechanical analysis is presented of the cellular defomations which occur during the opening and closing of stomata. The aperture of the stomatal pore is shown to be a result of opposing pressures of the guard and adjacent epidermal cells. The analysis indicates that the epidermal cells have a mechanical advantage over the guard cells. With no mechanical advantage, an equal reduction in the turgor pressure of both guard and epidermal cells would have a neglible effect upon stomatal aperture. However, due to the mechanical advantage of the surrounding cells, the stomatal aperture increases with equal reductions in turgor, until the adjacent epidermal cells become flaccid. The minimum diffusion resistance of the pore occurs at this point. Further reductions in guard cell turgor lead to closure of the pore. The analysis further demonstrates how the shape, size, wall thickness and material properties of the guard cell walls influence their behavior.--Copyright 1974, Biological Abstracts, Inc.

GROWTH FACTORS IN THE FISH MEAL COMPONENTS OF CATFISH DIETS,
Georgia Univ., Savannah. Agricultural Experiment Station.
J. W. Andrews, and J. W. Page.
Journal of Nutrition, Vol 104, No 8, p 1091-1096, 1974.

Descriptors: Catfishes, Amino acids, *Fish diets, *Growth rates, *Channel catfish, Protein, Lipids.
Identifiers: Menhaden meal, Soybean meal.

Four feeding studies were conducted to determine to what extent soybean meal could be used to replace fish meal in diets for channel catfish (Ictalurus punctatus). When soybean meal was substituted on an isonitrogenous basis for menhaden meal, growth and feed efficiency were substantially reduced ($P < 0.05$). Gains were not enhanced when synthetic methionine, cystine or lysine, the most limiting amino acids as the results of this substitution, were added to the soy-substituted diets. When diets void of fish meal were supplemented with a lipid extract, nonlipid residue or ashed fraction of menhaden meal, growth and food conversion data revealed that the growth factors not provided by soybean meal were in the nonlipid residue of menhaden meal and were destroyed by ashing. A further study demonstrated that these factors were not polar lipids that could be removed by extraction with chloroform-methanol (2:1). These data suggested that the growth factors were in the protein fraction of menhaden meal but do not explain why growth responses were not obtained when the soy-substituted diets were supplemented with the most limiting amino acids.--Copyright 1974, Biological Abstracts, Inc.

In: Proceedings Symposium on Statistical Hydrology, Arizona University, Tucson, August 31-September 2, 1971. Miscellaneous Publication No 1275, p 262-286, June 1974. 9 fig, 24 ref. NSF Grant GK 11499.

Descriptors: *Bed load, *Sediment transport, *Model studies, *Stochastic processes, Movement, Flow, Sediment load, Running waters, Tractive forces, Streamflow, Probability, Mathematical models, Geology, Hydrology.
Identifiers: Single particle movement.

Research in stochastic models for bed load transport was reviewed, summarized, and critically examined. Discussions were given for (1) theoretical models in deriving the distributions of the step lengths and the rest periods, (2) theoretical derivation of the probability density function of the distance at a given time, (3) calculation of bed-load transport from stochastic models, and (4) experimental evidence (including recent single particle experimental results by the authors). The order of generality of all existing theoretical models was evaluated and the relationships among these were given. (See also W75-10507)

A STOCHASTIC MODEL OF SEDIMENT YIELD FOR EPHEMERAL STREAMS,
Agricultural Research Service, Fort Collins, Colo.
D. A. Woolhiser, and P. Todorovic.
In: Proceedings Symposium on Statistical Hydrology, Arizona University, Tucson, August 31-September 2, 1971. Miscellaneous Publication No 1275, p 295-308, June 1974. 5 fig, 2 tab, 15 ref, 2 append.

Descriptors: *Sediment yield, *Ephemeral streams, *Model studies, *Stochastic processes, Sedimentation, Sediment transport, Sedimentation rates, Streamflow, Precipitation(Atmospheric), Runoff, Rainfall, Discharge(Water), Bed load, Suspended load, Hydrology.

The accumulated sediment yield of an ephemeral stream in some time interval may be treated as the sum of a random number of random variables. The number of sediment yield events in this interval is equal to the number of runoff events and is related to the number of precipitation events. Three progressively more complicated rainfall-runoff models were postulated: (1) the pure threshold model, (2) the general threshold model, and (3) the infiltration model. Analytic results for the runoff counting process were obtained for the pure threshold model and an approximation to the infiltration model was proposed. The resulting runoff counting process gave a good fit to data from two small watersheds near Hastings, Nebraska. An example was given of the application of the stochastic model of sediment yield to the problem of estimating mean and variance of annual sediment yield if only short concurrent records of sediment yield and runoff are available, but longer records of precipitation and runoff can be utilized. **COMPETENCE OF RIVERS TO TRANSPORT COARSE BEDLOAD MATERIAL,**
Texas Univ. at Austin. Dept. of Geological Sciences.
V. R. Baker, and D. F. Ritter.
Geological Society of America Bulletin, Vol 86, No 7, p 975-978, July 1975. 1 fig, 27 ref.

Descriptors: *Sediment transport, *Geomorphology, *Fluvial sediments, *Rivers, Erosion, Alluvium, Shear stress, Bed load, Coarse sediments, Particle size, Sediment load, Sedimentation, Hydraulics, Entrainment, Flow, Depth.
Identifiers: *Flow slope, Lift forces.

Shear-stress analyses provide easily determined estimates of the competence of rivers to transport coarse bed load material. Relevant data from diverse geological and engineering reports were integrated, and a good correlation between competent particle size and shear stress resulted when data points were derived in a uniform way. Because flow mechanics differ in contrasting fluvial environments, the shear stresses needed to entrain large sediment may diverge considerably from values based on theoretical grounds. In shallow rivers, entrainment may occur at lower shear stresses than predicted by the Shields theory because hydrodynamic lift and bank caving provide additional transporting force. In very deep flows, the shear stresses needed to initiate particle movement were greater than theoretical values. Potential use of the empirical relationship between particle size and shear stress was limited by the following considerations: (1) random nature of turbulent lift forces; (2) problems in interpreting the significance of the sedimentary deposit; (3) sediment finer than 5 cm in diameter was not considered; and (4) the analysis ignored special considerations of sediment packing, shape, and grain-size distributions. (Lee-ISWS)

**SEDIMENT CHARACTERISTICS OF STREAMS IN THE EASTERN PIEDMONT AND WESTERN COASTAL PLAIN REGIONS OF NORTH CAROLINA,**
Geological Survey, Raleigh, N.C.
C. E. Simmons.
Open-file report 75-291, 1975. 33 p, 9 fig, 5 tab, 13 ref.

Descriptors: *Sediment transport, *Sediment yield, *Sediment distribution, *North Carolina, Streamflow, Coastal plains, Slopes, Topography, Land use, Runoff, Storms, Reservoirs, Sediment discharge, Sedimentation rates, Data collections, Sampling, Suspended solids, Particle size.
Identifiers: *Piedmont region(NC).

The sediment-transport characteristics of streams were determined in a 6,000-square-mile area of the Coastal Plain and Piedmont regions of eastern North Carolina during 1969-73. The study covered all or parts of 21 counties and included data for 28 sediment-sampling stations located in parts of 4 major river basins, the Roanoke, Pamlico, Neuse, and Cape Fear. Annual suspended-sediment yields ranged from 333 to 12 tons per square mile. Streams in the Piedmont region have the highest yields. Suspended-sediment yield decreases in an eastward direction from the Piedmont to the Coastal Plain region. Sediment characteristics are directly affected by topography, storm runoff, geology, land use, and manmade detention structures. At one sampling station in the 1973 water year, 44 percent of the suspended sediment tonnage was transported during 34 days of high flow. In the Piedmont region, sediment yields vary indirectly with the percentage of forest cover in the basin, but there appears to be no definite relationship between forest cover and yield in the Coastal Plain region. Large lakes act as sediment-detention reservoirs. Average annual sediment yields ranges from 98 to 333 tons per square mile for 3 headwater streams which flow into Hydo Lake in Person County; however, the yield for the station less than 2 miles downstream from Hyco Dam was about 12 tons per square mile. Most suspended sediment during floods in Piedmont streams ranges in size from sand to silt, whereas the suspended material in flooding streams in the Coastal Plain is generally clay size. In: Present and Prospective Technology for Predicting Sediment Yields and Sources, USDA, Pub. No. ARS-S-40, June 1975, p 100-108, 6 fig, 1 tab, 11 ref.

Descriptors: *Sediment discharge, *Sediment transport, *Suspended sediments, *Sediment load, Sedimentation, Sediment yield, Open channel flow, Sampling, Runoff flow, Erosion, Agricultural watersheds, Measurement, Mathematical models, River flow, Water measurement, Watersheds(Basins), Computer models, Sediment distribution, Soil erosion, Velocity, Hydrology, Hydrometry.
Identifiers: *Bed-material transport, *Sediment measurement, *Sediment models.

A procedure is presented that computes bed-material transport near the streambed in the unsampled portion of a stream cross section. Its principal use is where accurate unmeasured loads are designed for addition to measured loads determined with conventional, depth-integrated, suspended sediment samples. For each computation two or three point suspended sediment samples and two or three velocity measurements must be taken below mid-depth at each of several stream verticals. Sediment concentrations by particle-size ranges and respective depths define concentration distribution equations for each vertical. Velocities and respective depths define a velocity distribution equation for each vertical. Summation of the products of respective concentration and velocity equations integrated over the unsampled depth represents sediment transport in the unsampled zone. (ARS)

**FAST SEPARATION OF TIN (IV) FROM TIN (II) AND FROM NUMEROUS METAL IONS ON ION-EXCHANGE PAPERS,**
Tabriz Univ. (Iran). Analytical Lab.
W. Husain, and M. Gulabi.
Separation Science, Vol 6, No 5, p 737-739, October 1971. 2 tab, 7 ref.

Descriptors: *Separation techniques, *Tin, *Cations, *Chromatography, Ions, Ion-exchange, Solvents, Analytical techniques, Metals, Pollutant identification, Chemical analysis.

A fast method for the separation of tin(IV) and tin(II) was developed on titanic tungstate ion-exchange papers. To develop a suitable method of separation, a large number of solvent systems were tried. A mixture of 0.5M ammonium acetate and 0.1M acetic acid in the volume ratio 2:1 was the most suitable solvent system for fast separations. Tin(IV) could also be separated from 40 other cations on the papers in only 20 minutes. (Jernigan-Vanderbilt)

**SPECTROSCOPIC DETERMINATION OF ATOMIZATION EFFICIENCY (CUCL-CU+CL) IN AN AIR-HYDROGEN FLAME,**
Nagoya Univ. (Japan). Dept. of Synthetic Chemistry.
K. Kitagawa, M. Yanagisawa, and T. Takeuchi.
Analytica Chimica Acta, Vol 68, No 1, p 212-216, January 1974. 1 tab, 4 fig, 6 ref.

Descriptors: *Analytical techniques, *Copper, Efficiencies, *Flame photometry, Spectroscopy, Chemical reactions, Laboratory tests, Testing procedures, Pollutant identification, Chemical analysis.

An equation for the comparison of ionic and atomic lines in determining the atomization efficiency of absorption spectrometry was derived. In the experimental work, a solution of copper (II) chloride was sprayed into an air-hydrogen flame supported by a Beckman burner, and two atomic copper lines and a CuCl line consisting of many rotational lines were observed. The atomization efficiency was 70-90% in the temperature range of 1,700-2,200 K. The high excitation temperature did not cause high atomization efficiencies which suggests that atoms obtain energy after dissociation, and that the excitation temperature is not necessarily consistent with translational, vibrational, or rotational phenomena in the diffusion flame. The method is valid for most experimental purposes with an advantage that no reaction equilibrium is assumed. (Jernigan-Vanderbilt)

**RAPID EXTRACTIVE SPECTROPHOTOMETRIC DETERMINATION OF GOLD (III) WITH 4-(2-PYRIDYLAZO)- RESORCINOL,**
Indian Inst. of Tech., Bombay. Dept. of Chemistry.
S. G. Nagarkar, and M. C. Eshwar.
Analytica Chimica Acta, Vol 71, No 2, p 461-463, August 1974. 1 fig, 1 tab, 11 ref.

Descriptors: *Spectrophotometry, *Gold, *Analytical techniques, Testing procedures, Separation techniques, Statistics, Pollutant identification.

A method for the determination of gold (III) is described that compared favorably in accuracy and sensitivity with other methods, and took less than 20 min. for extraction and determination. The relative standard deviation, calculated from 10 determinations with 240 micrograms of gold(III) in 25 ml was plus or minus 1.10%. The effects of reagent concentration and acidity, tartaric or citric acid, and nonaqueous solvent and stability were discussed. The complex showed maximal absorbance at 540 nm. Beer's law was obeyed in the concentration range 3.5-18 micrograms Au(III) per ml. The interference of about 40 ions was studied for solutions containing 9-60 micrograms Au(III) per ml. Identifiers: *Aya Water basin(Japan).

The differences in chemical composition of the groundwater and river water of the Aya Water basin, Japan, were investigated between May 1969 and January 1970. In the upper mountaneous district of the Aya Water basin, all measurements of chemical composition, including total hardness, Ca hardness, Cl, SiO2, and total residue, except for COD, were higher in the groundwater than in the river water. The weight ratios, groundwater to river water, total residue to total hardness, and Ca hardness to Cl hardness, were determined. Fluctuation of values of the chemical composition during a given year were also studied. (Prague-FIRL)

Identifiers: *Infrared radiometer, Monochromatic surface waves.

Convergent or divergent flows on a cooled ocean surface can induce surface temperature fluctuations. This effect is important for the interpretation of infrared radiation from the ocean. Laboratory experiments under controlled conditions were conducted to measure surface temperature fluctuations induced by surface waves whose dynamic characteristics could also be measured. The surface waves were produced in the laboratory. An infrared radiometer was used to measure the temperature changes. The major experimental task was to discriminate between the thermal and reflectance contributions to the wave-induced total radiometric signal. A technique to measure the upper bound of the reflectance contribution was developed, validated, and implemented. The magnitude of measured temperature fluctuations induced by small monochromatic surface waves agreed well with predictions from linear theories. In the linear wave dynamic regime the amplitude of the wave-induced temperature fluctuation is dependent on the near-surface heat transfer. This dependence was found to be linear by systematically increasing the surface heat transfer by means of an increase in wind velocity. (Singh-ISWS)

Identifiers: Joint probability density, Marginal density, Wave theory.

A theoretical expression for the joint distribution of wave period and amplitude, which was previously derived for a Gaussian record with a narrow spectrum, was restated in simple form. According to this distribution, the variability of wave periods for waves of a given height is inversely proportional to the wave height and the higher waves tend to be more regular. The distribution was found to agree well with observations of wave periods and amplitudes from the Gulf of Mexico. In shallow water, especially for steep waves, the distribution can be expected to be less applicable because of the enhanced nonlinearity. (Singh-ISWS)

Descriptors: *Waves(Water), *Ocean waves, *Model studies, *Atlantic Ocean, *Continental shelf, Coasts, Shallow water, Shores, Geomorphology, Mathematical models, Mathematical studies, Shoals.
Identifiers: *Virginian Sea.

A description was presented of the development and preliminary results of the Wave Climate Model of the Mid-Atlantic Continental Shelf and Shoreline (Virginian Sea), a joint effort of the Virginia Institute of Marine Science and the Langley Research Center. A review of the shelf geomorphology was also presented because the most important influence on the wave climate of this shelf is the interaction between the ocean waves and the various shelf relief elements. The Virginian Sea Wave Climate Model differs from previous models in the following important elements: (1) The model covers a very large geographic area of the continental shelf and shoreline, Cape Henlopen, Delaware, to Cape Hatteras, North Carolina, an area of 20,000 square nautical miles within a single large grid. (2) Distortions due to flat representations of the spherical Earth and problems resulting from the fact that waves travel great circle paths were overcome by constructing a Transverse Mercator map projection tangent to the Earth along the center of the grid. (3) An improved understanding of wave behavior in the area of crossed wave rays is now available from theoretical studies. (Sims-ISWS)

## 3B. Water Yield Improvement

**LAND USE SIMULATION MODEL OF THE SUBALPINE CONIFEROUS FOREST ZONE,**
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
C. F. Leaf, and G. E. Brink.
Research Paper RM-135, 42 p, February 1975. 9 fig, 16 ref, 5 tab.

Descriptors: *Computer models, *Simulation analysis, *Forest management, Hydrology, Watershed management, *Land use, *Weather modification, *Lumbering, Evapotranspiration, Soil water, Snow cover, *Coniferous forests, Water yield, Water yield improvement, Watersheds(Basins), Interception, Sediment yield, Clear-cutting.
Identifiers: Forest cover.

A dynamic model simulates the short- and long-term hydrologic impacts of combinations of timber harvesting and weather modification to develop management strategies for planning intervals which can vary from a few years to the rotation age of subalpine forest (120 years and longer). Management strategies may subdivide a given planning unit, defined by environmental characteristics, into as many as eight distinct response units, which may be managed independently. Different cutting practices may be imposed on the response units, and any number of cuttings can be made at specified years during the planning interval. All interactions between the various response units are accounted for in both time and space. Moreover, the model contains time trend functions which computer changes in evapotranspiration, soil water, forest cover density, reflectivity, interception, snow redistribution, and sediment yield as the forest stands respond to timber harvesting. (Witt-IPC)

**WATERSHED MANAGEMENT IN THE ROCKY MOUNTAIN SUBALPINE ZONE: THE STATUS OF OUR KNOWLEDGE,**
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
C. F. Leaf.
Research Paper RM-137, 31 p, February 1975. 18 fig, 77 ref, 9 tab.

Descriptors: *Forest management, *Watershed management, *Water yield, *Reviews, Simulation analysis, *Rocky Mountain Region, Wyoming, Colorado, New Mexico, Snow cover, Snowmelt, Runoff forecasting, Lumbering, Weather modification, Water supply, Land use, Model studies, Watersheds(Basins), Water sources, Mountains, Water yield improvement, Land use.
Identifiers: Subalpine watersheds.

Watershed management in the subalpine zone of Wyoming, Colorado, and New Mexico is described. Forest hydrology is briefly discussed, followed by an in-depth discussion and review of field studies of the effects of watershed management practices on snow accumulation, melt, and subsequent runoff; and simulation models designed to predict the hydrologic impacts of timber harvesting and weather modification. Pertinent literature is included, along with unpublished research, observations, and experience. Research needs are highlighted, and guidelines for implementing watershed management principles in land use planning are summarized. (Witt-IPC)

**SIMULATING TIMBER YIELDS AND HYDROLOGIC IMPACTS RESULTING FROM TIMBER HARVEST ON SUBALPINE WATERSHEDS,**
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
C. F. Leaf, and R. R. Alexander.
Research Paper RM-133, 20 p, February 1975. 9 fig, 17 ref, 11 tab.

Descriptors: *Computer models, *Forest management, *Watershed management, *Water yield, Hydrology, Simulation analysis, Rocky Mountain Region, Snow cover, Snowpacks, Snowmelt, Runoff forecasting, Solar radiation, Model studies, Water supply, Lumbering, Watersheds(Basins), Water sources, Mountains, Water yield improvement.
Identifiers: *Timber yield, Subalpine watersheds.

A dynamic simulation model which has been specifically designed to determine the hydrologic changes resulting from timber harvesting and correlary models which simulate timber yields are described. Emphasis is placed on the planning unit which is defined by environmental characteristics, including combinations of slope, aspect, elevation, and forest cover. The models are intended for use on subalpine watersheds where the primary source of streamflow is from melting snow. The hydrologic model simulates winter snow accumulation, the short- and longwave radiation balance, snowpcake condition, snowmelt, and subsequent runoff in time and space. The timber models simulate projected timber yields in response to changes in cultural treatments and/or variations in original stand and site conditions. The models have been used to simulate the effects of forest and watershed management on several representative drainage basins in the Rocky Mountain Region of the United States. Projected hydrologic changes and growth and yield subsequent to timber harvesting in lodgepole pine and spruce-fir are described. (Witt-IPC)

**HYDROLOGIC RECONNAISSANCE OF THE SOUTHERN UINTA BASIN, UTAH AND COLORADO,**
Geological Survey, Salt Lake City, Utah.
D. Prince, and L. L. Miller.
Utah Department of Natural Resources, Salt Lake City, Technical Publication No 49, 1975. 66 p, 11 fig, 3 plate, 15 tab, 38 ref.

Descriptors: *Water resources development, *Groundwater resources, *Surface water availability, *Utah, *Colorado, Hydrologic data, Hydrologic cycle, Water importing, Water utilization, Irrigation, Water yield, Water quality, Arid climates, Semiarid climates.
Identifiers: *Southern Uinta basin(Utah and Colo).

The southern Uinta Basin covers about 4,900 square miles in northeastern Utah and northwestern Colorado. For the most part, it is an arid to semiarid region. During the period 1941-70, average annual precipitation ranged from less than 8 inches in the north-central part to more than 26 inches in the extreme western part. The area averages about one person for every 4.5 square miles. It is utilized mainly for livestock grazing and the production of oil and gas. Net imports of water from the Duchesne River for irrigation within the southern Uinta Basin average about 70,000 acre-feet per year as of 1972. About 94% of the average annual water supply from precipitation and imports is consumed within the southern Uinta Basin by evapotranspiration and sublimation from the winter snowpack. Both the surface water and groundwater are saline throughout a major part of the basin. Only in the headwater areas along the south rim of that subbasin can fresh water generally be found. The most promising opportunities for obtaining large sustained water supplies are surface reservoir storage of runoff in the headwaters of the larger streams. (Woodard-USGS)

**WATER-YIELD IMPROVEMENT FROM ALPINE AREAS: THE STATUS OF OUR KNOWLEDGE,**
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
M. Martinelli, Jr.
Research Paper RM-138, March 1975. 16 p, 12 fig, 1 tab.

Descriptors: *Alpine, *Snow management, *Water yield improvement, *Snowpacks.
Identifiers: Snow fences, Blowing snow, Snow accumulation.

Snowpack management can be effective means of improving water yields from the already productive alpine type. Snow accumulates in the lee of terrain breaks, and fences upwind of natural accumulation areas effectively trap additional snow. Snowfences can also control blowing and drifting snow on highways and in avalanche-prone areas. (Forest Service)

**PRIORITY PROBLEMS FOR MODIFYING CUMULUS PRECIPITATION,**
Colorado State Univ., Fort Collins. Dept. of Atmospheric Science.
L. O. Grant.
In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York p 131-146, 1974. 2 tab, 10 ref.

Descriptors: *Precipitation(Atmospheric), *Weather modification, *Clouds, Artificial precipitation, Research priorities, Cloud seeding, Cloud physics, Meteorology, Precipitable water.
Identifiers: *Cumulus precipitation.

Cumulus clouds are extremely complex. It seems unlikely that the model calculated and field demonstrated seeding effects of individual small cumuli can substantially alter the areal precipitation, at least on the High Plains. High priority scientific problems in the development of a technology of cumulus modification for augmentating precipitation include: (1) a lack of detailed observational description of individual clouds and of cloud interactions, (2) the absence of cloud model verifications and evaluations, (3) a lack of understanding of cloud interactions with their environment and with each other, and (4) the complexity of developing an experimental design for conducting cumulus seeding experiments. **WEATHER MODIFICATION FOR USE IN THE HIGH PLAINS,**
South Dakota School of Mines and Technology, Rapid City. Inst. of Atmospheric Sciences.
R. A. Schleusener and J. R. Miller, Jr.
In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 147-164, 1974. 9 fig, 3 tab, 11 ref. DOI 14-06-D-6796, 14-06-D-6660, NOAA N 22-188-72(N).

Descriptors: *Weather modification, *Cloud seeding, *Decision making, *South Dakota, Artificial precipitation, Water supply, Precipitation(Atmospheric), On-site investigations, Technology, Projects, Clouds, Rainfall, Hail, Insurance, Storms, Cloud seeding, *Great Plains.
Identifiers: *Hail suppression, *High Plains.

The development and extent of use of weather modification in the High Plains were examined. Data presented were in the nature of a progress report. The decision processes involved in a scientific experiment and in a users' decision to utilize weather modification were contrasted. The extent of use of weather modification and the basis for decisions made to use weather modification in the Plains were examined. Weather modification was being used in 28 projects in 6 states in the summer of 1973 in the Plains. Research results on seeding for rain increase give statistically significant rainfall increases for individual clouds less than 30,000 ft in depth, suggest rainfall increases for areas of about 1000 sq mi, and are non-existent for areas in the Plains larger than 10,000 sq mi. Research results on seeding for hail suppression over the north central Plains suggest hail suppression of about 50% and provide an adequate basis for some user groups to proceed with applied programs. Improved methods are needed to evaluate applied projects. Future needs require reduction of scientific uncertainties and ability to respond to user needs within the constraints imposed by society. W75-10775

**USERS' VIEW OF WEATHER MODIFICATION,**
Kansas State Senate, Topeka. 39th District.
D. Christy.
In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 165-170, 1974.

Descriptors: *Weather modification, *Cloud seeding, *Artificial precipitation, *Kansas, Benefits, Legal aspects, Droughts, Precipitation(Atmospheric), Agriculture, Meteorology.

The writer's experience with weather modification efforts in Kansas were reviewed. It was concluded that weather modification is valid, that hail suppression has a good probability of being justified, and that there is a lot to learn. It was suggested that during the developing years, attempts at weather modification should be instituted by citizens as they have been in the past. As public support develops, permissive type of legislation should be instituted so that state government could help when an area wants the modification bad enough to do something about it. National research should continue with more emphasis on the command type of 'Break the Drought' applications. (See also W75-10769) (Sims-ISWS)

**ROLE OF THE PUBLIC IN WEATHER MODIFICATION,**
Colorado State Univ., Fort Collins.
A. R. Chamberlain.
In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 171-177, 1974.

Descriptors: *Weather modification, *Cloud seeding, *Social participation, Decision making, Public rights, Economics, Social aspects, Precipitation(Atmospheric), Rainfall.
Identifiers: *Public involvement.

Weather modification is too important f
major decisions to be left to the scientists
gineers. The lay citizen is supportive of bu
terested in seeking involvement in lab
research or in small scale field research
ments conducted with the knowledge of
group of very local people. As the scientist
gineer move along an activity spectrum
development and operations, the role and
of the public increases very markedl
scientists and engineers who have miss
point quickly find themselves cast into ad
relationships and conflict with the public
merous consumer and environmental o
tions. Frequently years of delay result
delays can be avoided or reduced if we be
to apply better decision models that bring
and public together in the formative stage
ject and to initiate more effort to develo
system decision making techniques that
commodate quality, value, and other unm
ble but definable items. (See also W7

THE MASTER PLAN FOR WATER-SUPPLY IN THE REGIONAL MUNICIPALITY OF OTTAWA-CARLETON,
Ottawa-Carleton Regional Municipality, Ottawa (Ontario).
F. E. Ayers.
Journal of the American Water Works Association, Vol 67, No 1, p 1-5, Jan 1975. 5 fig.

Descriptors: *Comprehensive planning, *Water supply development, *Water distribution(Applied), *Water demand, *Distribution systems, *Regional analysis, Hydrostatic pressure, Pressure conduits, Networks, Supply, Water storage, Water management(Applied), Water districts, Governments, Regions, Water resources development, *Canada.
Identifiers: Ottawa-Carleton Regional Municipality(Ontario-Canada), Ottawa River.

The Regional Municipality of Ottawa-Carleton, the first in Ontario, Canada, must supply and distribute water to the 425,000 residents in the cities of Ottawa and Vanier, 3 villages, and 11 townships. Two engineering firms developed short term plans based on a projected 1990 population of 635,000 and long term plans based on a population of 1,000,000 by the year 2030. Per capita consumption figures and average and maximum-day demand as well as maximum-hour demand figures were computed. The existing system which distributed purified water from the Ottawa River through three major pressure districts was studied. Network analysis was employed to find the best arrangement to integrate the central system with outlying areas presently bing served by up to 20 low capacity wells and to provide for regional growth at the same time. Additional filtration will be provided by upgrading both existing plants. Expansion plans are formulated for 6 pressure districts. To provide emergency reserves, 29.5 mil gal of additional ground reservoirs and four new 1-million-gallon elevated tanks are being added. Major mains from 24 to 60 inches in diameter are being constructed for maximum-hour demands and reservoir filling, as well as many smaller links in the distribution system. Substantial orderly construction progress is being made to serve the development of the area anticipated by the recently adopted master plan. (Herr-North Carolina)

FINANCING WATER WORKS,
Studley Shupert and Co., Inc., Boston, Mass.
W. P. Coues.
Journal of New England Water Works Association, Vol 87, No 3, p 207-217, Sept 1973.

Descriptors: *Bond issues, *Interest rates, Debt, Capital, Repayment contracts, Economics, Planning, *Financing, Investment, Financial feasibility, Return(Monetary), *Water works, Public utilities, Utilities.

General advice and instructions are given on procedures and financial obligations which a water utility should consider before selling bonds to raise money for improvements. The author, an investment counselor, considers the problem of bond financing for water works from both the perspective of the the utility and of the investor. Prevailing national business and economic conditions in the fall of 1972 are reviewed and short-range forecasts are offered for prospects of the money market, which must be considered by local authorities attempting to sell bonds. Since water utilities traditionally have had stable earnings, particularly where sales are to residential and commercial customers, investors in utility revenue bonds are more interested in the financial status of the community and less concerned about the specifics of its water utility plant and operation. They seek solidly based, professionally organized and formulated bond offerings. Professional assistance from bankers and legal counsel is urged, with special emphasis on seeking legal advice from a firm specializing in bond financing. Lists of specific procedures to be followed or avoided are offered, as well as a description of the characteristics of ideal financial conditions which bond dealers prefer. (Herr-North Carolina)

WATER WORKS IMPROVEMENTS--SPRINGFIELD, VERMONT,
Dvfresne-Henry Engineering Corp., North Springfield, Vt.
G. R. Allen.
Journal of New England Water Works Association, Vol 87, No 2, p 115-127, June, 1973. 10 fig.

Descriptors: *Distribution systems, Water distribution(Applied), *Water supply development, *Water delivery, *Hydraulic systems, *Water management(Applied), Water supply, Water wells, Water pressure, Groundwater availability, Pumps, Safe yield, Piping systems(Mechanical), *Vermont, Long-term planning
Identifiers: *Springfield(VT), Weathersfield Reservoir(VT).

After thorough engineering studies the Town of Springfield, Vermont, has improved the effectiveness of its present water distribution system and made long range plans for future growth. In 1904 the Weathersfield Reservoir was built about 4 miles north of the town. With a safe yield of 200,000 G.P.D., it delivers water from about 260 feet above the town by gravity flow. In the 1940's and '50's two well fields were drilled and a hand-started booster pump was added. But by the 1960's the pressure during peak periods was inadequate due to increased consumption and the hilly topography of the newer development. In 1967 the deficiencies were dramatized by a $2.5 million fire loss at the high school despite 3 nearby hydrants. Flow and pressure were insufficient. A two phase improvement program was designed. The first phase, to improve distribution of present supply, is essentially complete at a cost of $873,680 with $563,000 paid by a H.U.D. grant. Two concrete distribution storage reservoirs were built to level the demand peaks. Four and one half miles of transmission mains and 8 automated pumps were installed to incorporate the reservoirs into and permit maximum use of the existing system. Phase two, to provide additional supply, will not need to be implemented before 1990 when consumption is expected to exceed the improved capacity. (Herr-North Carolina)

Identifiers: White water, Soviet Union(U.S.S.R.).

The All-Union Scientific and Technical Association of the Pulp and Paper Industry has developed a system for recording water consumption at pulp and paper mills. The system standardizes record keeping, explains how to calculate the overall consumption, and describes methods to be used for the determination of water consumption. The chapter devoted to the terminology to be used is discussed in this article. Recycled water is defined as water containing suspended and/or dissolved substances which is returned to the production line without any treatment (e.g., white water, or weak sulfite and kraft spent liquors used in pulp washing). Reused water is water containing suspended and/or dissolved substances which underwent treatment (cooling, purification, or both). Water successively used is water which has been used in one process, then used without any treatment in another process (or processes). Waste water (effluent) is water discharged into a river or another natural water reservoir after purification or without purification. Reused waste water is effluent which underwent purification in special equipment and is returned to the production line. (Stapinski-IPC)

orus, *Flooding, Oxidation, Nutrients,
ion, *Rice, Soils, *Soil management.
rs: *Philippine Islands.

enhouse experiments were conducted on 6
tatives Philippine lowland rice soils. The
l effects of flooding to rice vary with the
available soil P, as measured by P uptake.
f high P availability, no differences were
when rice was grown under constant
on partially oxidized profile or when
was delayed 15-35 days after seeding. The
eatments produced lower yields and P up-
omparison to constant flooding in soils of
to low P availability. When severe water
curred, rice growth, yield and P uptake
y decreased in all soils regardless of P
ty. Puddling flooded soils had no effect
ields or P uptake at harvest regardless of
ilability. Puddling unflooded soils severe-
sed growth and responses to applied P
vere soil shrinkage took place. The
of flooding on P uptake by rice depend
he available P level and the type of water
ent used.--Copyright 1973, Biological

rs: *Planting management, Phytoplank-
mination, Plant growth, *Barley, *Sugar
ttuce, *Chlorophyta, Seeds.

The effect of various quantities of a Chlorophyta phytoplankton culture on seed germination, seedling development, and yield was evaluated in both the laboratory and field. In the laboratory, 'Arivat' barley (Hordeum vulgare L.) seedlings were grown in aqueous solutions of phytoplankton culture. Shoot length was increased by 100 and 1000 ppm concentrations of the culture but was unchanged at 10000 and 100000 ppm. There was an inverse relationship between shoot length and shoot weight per unit length. In the field, barley seedling emergence was significantly increased by injecting diluted phytoplankton culture with the seed at a rate of 3 1/240 m of row. Preplant irrigation with a 1000 ppm dilution of phytoplankton culture in the field increased sugar beet (Beta vulgaris L.) and lettuce (Lactuca sativa L.) seedling emergence. Subsequent post-plant applications of the phytoplankton resulted in additional increase in seedling emergence. Increased production was found for the sugar beets at all levels of treatment. This further increase could not be allocated to either growth regulator or soil modification but could be the result of both acting at once.--Copyright 1973, Biological Abstracts, Inc.

**SOME EFFECTS OF FIELD WEATHERING OF SEED COTTON IN A DESERT ENVIRONMENT,**
Arizona Univ., Tucson. Dept. of Agronomy and Plant Genetics.
D. R. Buxton, H. N. Stapleton, Yahia Makki, and R. E. Briggs.
Agron Journal, Vol 65, No 1, p 14-17, 1973, Illus.

Descriptors: *Weathering, *Cotton, Seeds, Deserts, Environment, *Southwest US, Crop production, Harvesting.

In field studies in southwestern USA, cotton (Gossypium hirsutum L.) was machine picked about every 10 days to investigate the effect of weathering. Each harvest was from cotton not previously harvested. Other plots were harvested repeatedly by hand to determine the contribution of late-open bolls to changes in seed cotton properties. In a greenhouse study open bolls were weathered for 10 wk and sampled weekly. The bolls were moistened with 0.5 ml water/boll either weekly or twice weekly and compared with an unwatered check to investigate the effect of wetting and drying cycles that occur in the field from rain and dew formation. Weathering did not result in loss of dry weight of lint or seed. Upper-half-mean-fiber-length was significantly reduced by the 10-wk greenhouse weathering period, but fiber fineness and strength were not affected. Weathering in the field resulted in average reductions of 0.8, 0.8, and 1.0%/wk for upper-half-mean-length, strength, and fineness, respectively, during Oct. and Nov. Harvesting late in the fall will not reduce yield if cotton does not drop to the ground, but a reduction in fiber quality can be expected.--Copyright 1973, Biological Abstracts, Inc.

**WATER RESOURCES OF THE TOPPENISH CREEK BASIN, YAKIMA INDIAN RESERVATION, WASHINGTON.**
Geological Survey, Tacoma, Wash.
Available from NTIS, Springfield, Va 22161 as PB-243 749, $7.50 printed copy, $2.25 in microfiche. Water-Resources Investigations 42-74, January 1975. 144 p, 32 fig, 5 tab, 31 ref, 4 append.

Descriptors: *Water resources, *Indian reservations, *Washington, *Hydrologic data, Surface waters, Groundwater resources, Irrigation, Water resources development, Water wells, Well data, Aquifer characteristics, Water yield, Water levels, Water utilization, Hydrogeology, Streamflow, Hydrology, Surface-groundwater relationships.
Identifiers: *Yakima Indian Reservation(Wash), Toppenish Creek basin(Wash).

About 94 percent, or 655,000 acre-feet per year, of water used for irrigation in the Toppenish Creek basin of the Yakima Indian Reservation Wash., is diverted from the Yakima River, the eastern boundary of the reservation. The flows of Toppenish Creek and its tributaries are small in comparison, but they are vital to irrigation of areas upslope from the irrigation canals. About 17.5 acre-feet per year of groundwater from a basalt aquifer and about 3.5 acre-feet per year from young and old valley-fill aquifers also are used for irrigation in the basin. Each aquifer is capable of yielding more than 1000 gallons per minute to efficiently constructed wells. Owing to seepage from canals and irrigated lands, the groundwater level in the young valley fill aquifer is higher at present (1974) than in the past, but some water-level declines have occurred in the old valley fill and basalt aquifers. Water levels in wells tapping the basalt aquifer have been lowered in some places as much as 80 feet during the past 15 years. The young valley fill aquifer in the eastern part of the basin is the best source of groundwater. (Woodard-USGS)

**RESPONSES OF 'BEARSS' LEMON TO NITROGEN, POTASSIUM AND IRRIGATION APPLICATIONS,**
Agricultural Research and Educational Center, Lake Alfred, Fla.
R. C. J. Koo, T. W. Young, R. L. Reese, and J. W. Kesterson.
Proc Fla State Hortic Soc, 86 p 9-12, 1973(1974).

Descriptors: *Lemon, *Nitrogen, *Potassium, Irrigation programs, *Fertilizers, Fertilization, Fruit crops, Irrigation practices, *Crop production.
Identifiers: *Bearss lemon.

Results of a 4-yr study of young bearing 'Bearss' lemon on sour orang rootstock under 3 levels each of N and K fertilization and 2 levels of irrigation treatments are reported. Increased N application resulted in an increase in fruit production, peel oil content, scab infection and green fruit after curing. The latter 2 factors accounted for lower fresh fruit pack. Potash application increased the acid content of fruit. High soil moisture content maintained through irrigation resulted in increased fruit production, peel oil, scab infection, fruit size, and hastened fruit maturity. Different fertilizer and irrigation programs are suggested for fresh and processing lemons.--Copyright 1974, Biological Abstracts, Inc.

**RELATIONSHIPS BETWEEN DROUTH AND CORN YIELDS ON SELECTED SOUTH ATLANTIC COASTAL PLAIN SOILS,**
North Carolina State Univ., Raleigh.
C. D. Sopher, R. J. McCracken, and D. D. Mason.
Agronomy Journal, Vol 65, No 3, p 351-35[illegible], 1973. Illus.

Descriptors: *Corn(Field), Crop production, *Drought tolerance, *Coastal plains, *North Carolina, Soil-water-plant relationships, *Drought resistance.
Identifiers: Drought index.

The effects of drouth-days by physiological growth period on corn (Zea mays L.) grain yields was determined, and a 1-figure drouth index suitable for expressing these effects was developed. A drought-day was defined as a 24-hr period when potential evapotranspiration exceeds rainfall plus the effective moisture storage capacity. The physiological growth periods were: 2-equal-length periods prior to tasseling; tasseling; and a maturity period. The study was conducted on 2 major North Carolina Soil Groups. On the better drained (Udultic) soils of the Upper and Middle Coastal Plains, drough-days accounted for 62.6% of the corn yield variation. The effects of drouth were detrimental in the 2nd and 4th growth periods, and grain yields were reduced to zero after 5 drouth-days during the tasseling period. For the very poorly drained (Aquatic) soils of the Tidewater Region, drouth-days accounted for 41.2% of the yield variation. Detrimental drought-day effects were only present during the 2nd and tasseling periods. The reduction of the effects of drouth-days on these soils was attributed to moisture extrction from an underlying water table. Using the derived regression coefficients for weights, the drough-days by physiological growth periods were weighted and summed to develop a 1-figure drough-index This index may be used as a single climatic variable in regression-correlation studies of the crop-soil ecological system.--Copyright 193, Biological Abstracts, Inc.

**DEVELOPMENT OF LARGE SCALE DRIP IRRIGATION SYSTEMS,**
Superior Farming Co., Bakersfield, Calif.
B. R. Olson, Jr.
In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 311-316, 1974.

Descriptors: *Irrigation systems, *Evaluation, *Irrigation engineering, *California, Irrigation, Economics, Irrigation practices, Irrigation operation and maintenance, Irrigation design, Automation, Experimental farms, Agriculture, Argicultural engineering, Testing.
Identifiers: *Drip irrigation, Test plots.

Superior Farming Company owns and operates 37,000 acres (15,000 hectares) in the western United States from Tucson, Arizona, to Madera, California. Over 34,000 acres (13,800 hectares) are in operation near Bakersfield, California. Water and labor costs are fairly expensive and increasing rapidly. There were just two of the factors involved in the analysis of the benefits of drip irrigation. During the summer of 1970, Superior Farming Company embarked on an ambitious program of drip irrigated test plots on a variety of crops. The tests were conducted on tomatoes, almonds, citrus, grapes, plums, and apples. The plots included a variety of soil types, from a clay to sand, in different areas throughout California. The system was designed with the aid of a computer which minimized, for each joint of pipe, the annual depreciated pipe cost plus power costs for the underground hydraulic system. More practical, economical research is required concerning proper filtration for drip systems. Hopefully, new and better emitters will be designed within the next few years. The producing, commercial grower must always weight the economics of any irrigation system. Superior Farming Company feels that drip irrigation has a good economic outlook in some areas. **WATER USE AND PRODUCTION OF TRICKLE IRRIGATED ONIONS,**
New Mexico State Univ., University Park. Dept. of Agricultural Engineering.
T. C. Patterson.
In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 317-328, 1974. 4 fig, 2 tab, 8 ref.

Descriptors: *Irrigation, *Irrigation practices, *Irrigation efficiency, *New Mexico, *Onions, Crop response, Irrigation systems, Furrow irrigation, Sprinkler irrigation, Salinity, Agriculture, Crops.
Identifiers: *Trickle irrigation.

In acreage and value of production, dry onions are one of New Mexico's most important vegetables. The purpose of this study was to determine the extent to which sprinkler and trickle irrigation systems can be used to optimize water-use efficiency of onions by maintaining high water-application efficiency and continuous high levels of readily available moisture in the soil. The control was furrow irrigation applied according to local practice. This study also monitored the salinity levels under the various treatments. It was found that the use of trickle and sprinkler irrigation systems capable of efficiently applying light, frequent applications of irrigation water can significantly increase the water-use efficiency of onions. Total yield of onions can normally be significantly increased by maintaining higher soil moisture levels throughout the growing season. Irrigation systems operated at extremely high efficiencies result in considerable water savings, but without a leaching fraction added to depths of application, a rapid salt build up occurs. iers: *Trickle irrigation, Row crops, ge.

perly-managed trickle irrigation system provide a soil environment where the im possible water application will permit mination of seeds, emergence of seedlings, development of an adequate root system. principles of plant water needs are essen-ie same for trickle irrigation as for other ir-methods. Soil moisture must be main-n a range that permits adsorption of water t roots at a rate comparable to transpiration and the soluble salt content in the root zone ot limit plant growth and water absorption. search on the management of trickle irriga-ystems was conducted on cotton and e. Quantity and frequency of trickle irriga-possible increased yield and decreased ir-water requirement were evaluated and ed to standard-furrow irrigation practices. l and peak consumptive-use requirements, using trickle irrigation for cotton and production, appeared to be the same as ow irrigation. The capability of varying cy of trickle irrigation, depending on the l crop, would provide flexibility in the n of a trickle irrigation system. An overall n efficiency as high as 90% seems possible trickle irrigation of row crops with y available trickle irrigation systems. (See 5-10769) (Sims-ISWS)

rs: Root respiration, Grain filling.

environment of wheat (Triticum aestivum hell) was modified with flooding and soil ure treatments during the grain filling n assessment of the relation between root on and grain yield. Short term flooding ys) at 15-17 C soil temperature in a pot l experiment did not influence yield. erm flooding (20-30 days) reduced yield % at 15-17 C soil temperature and by 73% oil temperature. Yield reduction was as-with smaller mean grain weight. At 5C erature 30 days of flooding had no signifi-ct on yield. Stem dry weight per tiller l by about 25% with increase in soil tem-from 5 to 25 C for both flooded and non-reatments. Mathematical simulation esti-root respiration applied to the experimen-tal conditions indicated that roots were a minor sink for assimilate during the grain filling stage. Root environmental effects on wheat yield could not be interpreted in terms of roots being competitive with the developing grain for photosynthate. The significant effects of soil conditions on the maturing wheat plant indicate some importance of roots and root environment during the grain filling stage.--Copyright 1973, Biological Abstracts, Inc.

**NONLINEAR CHANNEL ROUTING BY COMPUTER,**
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
M. C. Quick, and A. Pipes.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY6, Proceedings Paper 11353, p 651-664, June 1975. 11 fig, 9 ref, 2 append.

Descriptors: *Channel flow, *Stage-discharge relations, *Canada, *Routing, *Hydraulic design, *Model studies, River forecasting, Digital computers, Flow, Storage, Channels, Design, Hydraulics, Hydrology, Simulation analysis.
Identifiers: *Fraser River(British Columbia), Wedge storage.

A simple but accurate nonlinear river channel routing method was developed which can be calibrated from standard water survey measurements of stage-discharge and stage-velocity. The flow model was based on well-established kinematic flood wave behavior. The routing coefficients were not derived from analysis of the inflows and outflows to a given reach, but were derived directly from the stream gaging data for each reach, i.e., the stage-discharge and the stage-velocity curves. The routing procedures are computationally simple and are described by equations. Because the procedure computes according to wave travel time, the storage term is purely wedge storage and this led to part of the simplification. Because the procedure operates on changes in flow, an extremely simple reservoir routing-method was derived. The model was designed for computation by digital computer, although hand computation is feasible for simple systems. (Lardner-ISWS)

**FLOOD PLAIN INFORMATION: OUACHITA RIVER, HOT SPRINGS CREEK, STOKES CREEK, MOLLY CREEK, GULPHA CREEK, CITY OF HOT SPRINGS, ARKANSAS.**
Army Engineer District, Vicksburg, Miss.

Prepared for the City of Hot Springs, Arkansas, June, 1974. 29 p, 15 fig, 24 plates, 7 tab.

Descriptors: *Floods, *Flooding, *Flood plains, *Flood profiles, *Flood forecasting, Flood data, Flood damage, Maximum probable flood, Historic floods, *Arkansas.
Identifiers: Hot Springs(Arkansas), *Ouachita River(Ark), Garland County(Ark), Hot Springs Creek(Ark), Stokes Creek(Ark), Molly Creek(Ark), Gulpha Creek(Ark), Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

The Ouachita River, which rises at Rich Mountain in the Ouachita Mountains west of Mena, Arkansas, and its tributary creeks, with drainage basins of rugged and steep terrain, flow through the Hot Springs, Arkansas area encompassing all types of urban, rural, and recreational land uses. Additional development is expected for the various floodplains as pressure for expansion increases. Carpenter Dam, owned and operated by Arkansas Power and Light Company since 1932, forms Lake Hamilton about 1 mile downstream from the junction of Hot Springs Creek and the Ouachita River. Gates at Carpenter Dam are also operated for maximum flood control. Blakely Mountain Dam, which forms Lake Ouachita, was constructed in 1944 on the Ouachita River about 10 miles above Hot Springs by the Army Corps of Engineers as part of a flood control program. Its flood gates are being operated to keep flooding at a minimum. Floods occur during all seasons. Much of the rainfall occurs in April and May with an average annual rainfall of 54 inches. The greatest flood of record occurred in May, 1923 when Hot Springs Creek had an elevation of 643.4 feet at mile 4.47 and extensive damage was caused by rushing flood waters on the city's main street. The elevation of the projected Intermediate Regional Flood (IRF) would be 646.3 feet and of the Standard Project Flood (SPF) would be 647.3 feet at mile 4.37. Peak discharge at the mouth of Hot Springs Creek would be 12,600 cfs for an IRF and 19,600 cfs for an SPF. Future damage could be extensive due to the high waters, high velocities and rapid rise of flood waters. (Park-North Carolina)
W75-10559

**FLOOD PLAIN INFORMATION: BUSHKILL CREEK, VICINITY OF EASTON, PENNSYLVANIA.**
Army Engineer District, Philadelphia, Pa.
Prepared for the Lehigh-Northampton County Joint Planning Commission, January, 1972. 26 p, 10 fig, 15 plates, 8 tab.

Descriptors: *Flood forecasting, *Flood plains, *Flood damage, Flood data, Flood profiles, Flood stages, Obstruction to flow, Land use, Planning, Historic floods, *Pennsylvania, Flash floods, Delaware River.
Identifiers: *Bushkill Creek(Pa), Easton(Pa), Flood plain management, Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

Aside from the City of Easton, Pennsylvania, located at the confluence of Bushkill Creek and the Delaware River, the flood plain of Bushkill Creek is mostly undeveloped. The upper and middle reach are characterized by low banks with gently sloping flood plains, the lower reach by steep banks, man-made fills, and retaining walls. Spring floods are caused by snowmelt runoff and heavy rains; fall floods by general rainfall runoff. Flash floods produced by local thunderstorms occur year-round. The most severe flood recorded, caused by a thunderstorm, occurred July 9, 1945 and had a magnitude between an Intermediate Regional Flood (IRF) and a Standard Project Flood (SPF). Based on gage information, an IRF would have a water surface elevation of 204.6 ft. m.s.l.d. and a peak discharge of 10,000 cfs at the creek's mouth; and SPF's elevation would be 207.2 ft. and peak discharge would be 24,500 cfs. In several locations, the water surface elevation of the July 1945 flash flood was greater than an IRF or SPF due to structures which were clogged with debris. There are 9 dams, 45 bridges, and 2 buildings that cross the creek and can create obstructions. (Diefendorf-North Carolina)
W75-10560

**FLOOD PLAIN INFORMATION: BLOOMSBURG, COLUMBIA COUNTY, PENNSYLVANIA-SUSQUEHANNA RIVER.**
Army Engineer District, Baltimore, Md.
Prepared for the Columbia County Planning Commission, Bloomsburg, Pennsylvania, February, 1974. 36 p, 3 fig, 13 plates, 8 tab.

Descriptors: *Flood plains, *Flood data, *Floods, *Flood profiles, Flood forecasting, Flood recurrence interval, Flood stages, Flood proofing, Nonstructural alternatives, Maximum probable flood, Regional flood, Flow duration, Historic flood, *Pennsylvania.
Identifiers: Bloomsburg(Pa), Columbia Co(Pa), *Susquehanna River(Pa), Fishing Creek(Pa), Catawissa Creek(Pa), Standard Project Flood, Intermediate Regional Flood.

Portions of Columbia County, Pennsylvania, were flooded extensively in 1936 and 1972 by waters from the Susquehanna River, Fishing Creek, and Catawissa Creek; studies indicate larger floods are possible. Unfortunately, there is continuous pressure to develop the flood plain due to the area's increasing population. Major floods on the Susquehanna River can occur during any season, but most have occurred in the spring. Although a combination of heavy rain and snowmelt caused past flooding, the largest flood of record resulted from Tropical Storm Agnes in June 1972 when heavy rains fell on previously saturated ground. As much as 16 inches fell in some areas of the Susquehanna basin with record runoffs. Flooding here causes moderately rapid rises in the river stage, is of long duration, and has a high flow velocity. During the June 1972 flood, the river rose one foot per hour and remained out of banks for 3 1/2 days, and water velocity was as high as 9 miles/hour. The river is crossed by two highway bridges and one railroad bridge, but the underclearances are above the Intermediate Regional Flood level, offering little flow obstruction. There are no flood control projects authorized, and while six upstream reservoirs lower the frequency of flooding, they do not provide complete protection. An Intermediate Regional Flood would rise 7 ft over 54 hours and stay above bankfull 96 hours; a Standard Project Flood would rise 35 feet in 96 hours and be above bankfull 148 hours. (Grden-North Carolina)
W75-10561

**FLOOD PLAIN INFORMATION: BRANDYWINE CREEK, CHESTER COUNTY, PENNSYLVANIA.**
Army Engineer District, Philadelphia, Pa.
Prepared for the Chester County Planning Commission, March, 1972. 24 p, 8 fig, 13 plates, 8 tab.

Descriptors: *Flood forecasting, *Flood plains, *Flood damage, Flood profiles, Historic floods, Flood stages, Obstruction to flow, Land use, Planning, *Pennsylvania.
Identifiers: *Brandywine Creek(Pa), Chester County(Pa), Chadds Ford(Pa), Lenape(Pa), Soil Conservation Service, Water Resources Authority, Flood plain management, Standard Project Flood, Intermediate Regional Flood.

This is the third of 4 reports on Brandywine Creek flooding. It covers 9.8 miles of the Main Stem beginning near the Pennsylvania-Delaware border continuing upstream to the confluence of East and West Branches near Lenape, Pennsylvania. The relatively broad flat flood plain, bordered by gently rolling hills, is rural and largely undeveloped. Floods generally occur in the summer and fall when rain is greatest. Obstruction to flow is created by 6 bridges and 3 dams which are the low-flow type with no significant storage or flo control capacity. Information on historic floods the Chadds Ford, Pa., gage gives largest flo records of 17,200 cfs in 1920 and 16,800 cfs 1942. At this gage, an Intermediate Regional Flo (IRF) would have a discharge of 24,000 cfs an Standard Project Flood (SPF) of 63,100 cfs. B would inundate residential, commercial, and dustrial properties, creating hazardous situatio The Soil Conservation Service has proposed c struction of 10 dams to be located on East West Branches which would reduce the IRF SPF discharges to 18,700 cfs and 49,200 respectively. The Water Resources Authority developed a plan for the purchase of wa resources protection rights in areas most critica water resources. (Diefendorf-North Carolina)
W75-10562

**FLOOD PLAIN INFORMATION: GOLDSMI GULCH, DUTCH CREEK, LILLEY GUL AND COON CREEK, VOLUME VI, DENV METROPOLITAN REGION, COLORADO.**
Army Engineer District, Omaha, Nebr.
Prepared for Denver Regional Council of Gov ments and the Urban Drainage and Flood Co District, October, 1971. 50 p, 20 fig, 21 plates tab.

Descriptors: *Floods, *Flooding, *Flood forec ing, *Flood flow, *Flood peak, Flood water, structions to flow, Tributaries, Maximum pr ble flood, *Colorado, Flood data, Flood plains
Identifiers: Goldsmith Gulch(Col), D Creek(Col), Lilley Gulch(Col), Coon Creek( Denver(Col), Denver County(Col), Arap County(Col), Intermediate Regional Flood, S dard Project Flood.

The four streams located at the southern edg Denver, Colorado, flow through areas underg urbanization and are susceptible to the f floods typical of the region. Goldsmith G draining 7.80 sq mi in southeast Denver an jacent Arapahoe Creek, has an average gradie 19.6 ft/mi with a maximum of 26.9 ft/mi. flood plain is narrow in the upper reaches widens slightly as it merges with the Cherry C flood plain.' Average channel depth is 4.5 ft average channel top width of 83 ft. Maxi channel top width is 200 ft. Planned subdivi are the predominant development pattern. By this basin is expected to be about 92% develo Dutch Creek and its major tributaries, L Gulch and Coon Creek, have narrow flood p which widen slowly in downstream direc Most basin land is presently agricultural with scattered urban development. Dutch Creek is anticipated to be about 36% developed by Past floods on the streams have been quick r of short duration, and caused by 'cloudburst storms. Based on data correlated for si streams since discharge measurements ar available specifically for the streams of th port, potential floods, the Intermediate Reg Flood (IRF) and the Standard Project Flood would have peak discharges of 3,500 cfs and cfs respectively on Goldsmith Gulch above and 3,750 cfs and 16,600 cfs on Dutch Creek the confluence with Coon Creek. Roads acro creeks would be in danger from the high v and high velocities. Accompanying tables plates give detailed data for points on the str (Park-North Carolina)

**FLOOD PLAIN INFORMATION: MEA CREEK, ALBEMARLE COUNTY AND C LOTTESVILLE, VIRGINIA.**
Army Engineer District, Norfolk, Va.
Prepared for Charlottesville and Albemarle ty, Virginia, January, 1972. 49 p, 7 fig, 14 pla tab.

Descriptors: *Floods, *Flooding, *Water m ment(Applied), *Virginia, *Flood profiles, plains, Flood control, Flood protection.

ifiers: *Meadow Creek(Va), Albemarle
nty(Va), Charlottesville(Va), Standard Project
d, Intermediate Regional Flood, Rivanna
(Va).

low Creek, a small stream whose flood plains
from 75 to 700 feet, flows easterly for 6 miles
ng in and out of Charlottesville, Virginia,
al times before emptying into the Rivanna
. The outer edge of the flood plain is defined
ruptly rising topography which curtails flood
s. Development in the flood plain consists of
a few scattered structures. Obstructions to
flow include bridges and culverts but
vater effects in a flood are relatively minor
o the stream's fairly steep slope. Minor to
rate flooding prevails in the spring, although
floods may occur at any time resulting from
general rains or from intense rainfall from
al storms. Duration of floods is short and the
rises rapidly to overbank stages. No flood
ge prevention measures currently exist. In
ce of data for Meadow Creek, information
ollected from nearby streams. The greatest
occurred in October 1942. At approximately
ft. above the mouth of Meadow Creek, an
ediate Regional Flood (IRF) would have
ischarge of 5,900 cubic feet per second (cfs)
naximum channel velocity of 12 ft/sec and
um overbank velocity of 5 ft/sec. A Stan-
roject Flood (SPF) at the same site would
rge 9,400 cfs with 14 ft/sec maximum
y channel flow and 6 ft/sec maximum over-
elocity. 'The SPF profile for Meadow Creek
vary from 1 to 7 feet higher than the IRF in
dy area.' (Salzman-North Carolina)

**FLOOD PLAIN INFORMATION: EAST FORK ONE HUNDRED AND TWO RIVER, BEDFORD, IOWA.**
Army Engineer District, Kansas City, Mo.
January, 1969. 34 p, 11 fig, 10 plates, 6 tab.

Descriptors: *Flood data, *Flood velocity, *Flood, *Flooding, *Flood plains, *Flood control, Flood protection, Flood frequency, Flood forecasting, Flow, Obstructions to flow, Rivers, *Iowa, Flow characteristics, Historic floods.
Identifiers: *Bedford(Ia), *East Fork One Hundred and Two River(Ia), Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

This report covers a 5-mile reach of the East Fork One Hundred and Two River as it flows through Taylor County, Iowa, in the vicinity of Bedford. Major floods occurred in January, 1960 and June, 1967 with elevations and peak discharges of 1078.5 feet at 5400 cfs and 1076.5 at 6800 cfs respectively. Reduced elevation despite greater flow was due to channel improvements which have been the only flood prevention measures. Primary use of the floodplain is agricultural although there is some industrial, municipal, and residential development that has been damaged in the past. Substantially more damage could be sustained in an Intermediate Regional Flood (IRF) or a Standard Project Flood (SPF) with crests of 1082.7 and 1085.9 feet respectively. Flood velocities, rates of rise, and durations could present greater hazards than previously. Velocities in the 1967 flood ranged from 6 to 11 feet per second; an SPF would have channel velocities up to 14.9 feet per second, which could cause considerable erosion, and overbank velocities up to 2.1 feet per second which could deposit debris from the river. These studies and predictions can be used as a basis for additional flood protection measures. (Park-North Carolina)
W75-10566

**FLOOD PLAIN INFORMATION REPORT: SENECA CREEK, MONTGOMERY COUNTY, MARYLAND.**
Army Engineer District, Baltimore, Md.
Prepared for Maryland-National Capital Park and Planning Commission, June, 1967. 13 p, 6 plates, 2 tab.

Descriptors: *Floods, Flood plains, *Flood protection, *Flood plain zoning, Planning, Land use, *Maryland, Flood proofing, Management.
Identifiers: *Floodplain management, *Seneca Creek(MD), Montgomery County(MD), Maryland-National Capital Park and Planning Commission.

Flood damages along Seneca Creek 15 miles northwest of Washington, D.C. at the time of this report were minor. The floodplain is primarily rural with the exception of the small town of Seneca on the Potomac at the creek mouth. July, 1956 was the major flood of record which caused four deaths and $200,000 to $300,000 in damage, generally to roads and bridges. Plates show the areas encompassed by the 1956 flood. A potential flood of 50-year frequency would vary little from this flood. The subdivision regulations of Montgomery County restrict development within the 50-year floodplain. Floodplain management recommended as a primary flood damage control measure should determine the limits of potential flood areas, provide access to flood-plain limits information, only plan development in floodplains of low-damage potential uses, and enforce existing laws and enact any new laws necessary to assure planned development in the floodplains. Cooperation and coordination of local, state, and federal policies is urged. A coordinated floodplain management program would reduce the demand for flood control structures which have already cost $5 billion for construction over the past 30 years. Preferable nonstructural alternatives are outlined. (Park-North Carolina)
W75-10567

**FLOOD PLAIN INFORMATION: MILL RUN, BLAIR COUNTY, PENNSYLVANIA.**
Army Engineer District, Baltimore.
Prepared for Blair County Planning Commission, Altoona, Pa. January, 1974. 22 p, 16 plates, 5 tab.

Descriptors: *Flood data, *Flooding, *Flood profiles, Flood damage, Flood forecasting, Flood protection, Flood recurrence interval, Flood peak, Flood discharge, Non-structural alternatives, Flash floods, Maximum probable flood, *Flood plain zoning, Flow duration, *Pennsylvania, Historic floods.
Identifiers: *Mill Run(Pa), Blair Co(Pa), Altoona(Pa), Standard Project Flood, Intermediate Regional Flood.

The probability and extent of future flooding along Mill Run in Blair County and the City of Altoona, Pennsylvania, is described to assist planners in minimizing vulnerability to flood damage through flood plain zoning, subdivision regulations, and flood protection works construction. The major flood of record occurred in 1936, although most property damage occurred in the September, 1967, flood. Residents report flooding in the Lleswen and Eldorado areas during 15 of the past 43 years. Flood determinations indicate that an Intermediate Regional Flood (IRF) would reach depths of 5.1 feet to 14.3 feet above streambed, and many of Altoona's bridges, residential areas, and light industrial areas would be inundated. Standard Project Floods (SPF) are not much higher, but the flooded areas and corresponding damage would be greater. There is also no definite flood season here. IRF water velocity ranges up to 14 ft/sec, but would be of short duration. The stream would rise from bankfull stage to its crest in 14 hours and return to its banks in less than 9 hours. No authorized flood control projects exist, and present zoning ordinances do not include flood plain zoning. (Grden-North Carolina)
W75-10568

**SPECIAL FLOOD HAZARD INFORMATION REPORT: CHICKASAWHAY RIVER, WAYNESBORO, WAYNE COUNTY, MISSISSIPPI.**
Army Engineer District, Mobile, Ala.
Prepared for Mississippi Research and Development Center, December, 1971. 10 p, 4 fig, 8 plates, 2 tab.

Descriptors: *Floods, *Flooding, *Flood plains, *Flood forecasting, Flood control, Flood protection, Historic floods, *Mississippi.
Identifiers: *Chickasawhay River(MS), Waynesboro(MS), Wayne County(MS), Intermediate Regional Flood, Standard Project Flood.

The Chickasawhay watershed in southeastern Mississippi drains an area of 2970 square miles. Within the 12-mile study reach its width varies between 100 and 250 feet with the bank height varying between 20 and 50 feet. The average slope is 0.7 feet per mile. The floodplain width varies from one to two miles. Development in the wide and flat floodplain at Waynesboro consists of residential areas interspersed with light industrial and commercial firms. Flood producing storms may occur anytime of the year. The major flood producing storms are usually of the frontal type which occur in winter and spring and last several days. Summer thunderstorms characterized by high intensities over small areas can cause flash flooding. A severe storm in summer or early fall can result from a tropical hurricane. No floodplain regulations exist. The largest flood occurred in April 1900 cresting at 170 feet, mean sea level (msl). The most recent flood on February 26, 1961 crested at 167.6 feet, msl. The 50-year flood and the Intermediate Regional Flood (IRF) would inundate the floodplain with the IRF affecting 3,700 acres of the 20,000 acres which comprise the Waynesboro Planning Area, with 400 acres flooded within the city limits. Floodplain management techniques to reduce damage are outlined. (Salzman-North Carolina)

W75-10569

**FLOOD PLAIN INFORMATION: BROOKINGS, BROOKINGS COUNTY, SOUTH DAKOTA, VOLUME I - DEER CREEK.**
Army Engineer District, Omaha, Neb.
Prepared for South Dakota Water Resources Commission and City of Brookings, April, 1973. 29 p, 22 fig, 10 plates, 4 tab.

Descriptors: *Flood plains, *Flood control, *Floods, *Flooding, Obstructions to flow, Flood forecasting, *South Dakota, Flood frequency, Flood damage, Flood protection.
Identifiers: *Deer Creek(SD), Brookings(SD), Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

Development in the 95-square mile basin of Deer Creek, a tributary of the Big Sioux River in Brookings County, South Dakota, is largely agricultural, with 71% cropland, 23% pasture, and 6% other land uses. Brookings is the major city in the study area (population 13.717 in 1970) and development on its eastern border has resulted in pressure for residential development in the flood plain. Research from residents and newspapers has established the flood history of Deer Creek. Serious floods were reported nine times from 1881 to 1969 with April 21, 1881 and May 3, 1912 the highest. Magnitude data is unavailable. Flows are obstructed by trees and brush growing on the flood plain and banks. Projected floods at the upstream limits of the study area are computed at a 8,180 cfs discharge for the Intermediate Regional Flood (IRF) and 20,180 cfs for the Standard Project Flood. The greatest historical flood may have approached the IRF with its 100 year frequency. The study makes no flood protection recommendations but states that some have already been developed. Brookings County has a flood plain ordinance, but the City of Brookings does not yet, and the entire length of lower Deer Creek falls within the extraterritorial planning and zoning boundary of the City of Brookings. (Park-North Carolina)
W75-10570

**FLOOD PLAIN INFORMATION: WHITE CLAY CREEK, NEW CASTLE COUNTY, DELAWARE.**
Army Engineer District, Philadelphia, Pa.
Prepared for the New Castle County Department of Planning, June, 1972. 27 p, 12 fig, 13 plates, 19 tab.

Descriptors: *Flood plains, *Flood damage, *Land use, *Planning, Flood data, Flood stages, Historic floods, Obstruction to flow, Dams, Hurricanes, *Delaware, Urbanization.
Identifiers: *White Clay Creek(DE), *Christina River(DE), New Castle County(DE), Newark(DE), Hurricane Agnes, Comprehensive development plan, Intermediate Regional Flood, Standard Project Flood, Floodplain management, Tidal flooding.

The total drainage area of White Clay Creek, a major tributary of Christina River, is 162 square miles. The floodplain along the upper reach is narrow, wooded, and mostly undeveloped. Along the lower reach development of the relatively wide flat floodplain is more concentrated, including industrial and commercial development at Newark, Delaware. There are 5 dams with no significant storage capacity. Twelve bridges and stored flotable material might cause obstruction to flood flow. The main flood season is summer and early fall due to major storms. Marshland near the confluence of White Clay Creek and Christina River is also subject to tidal and fluvial flooding from the river. The highest recorded stage, 34.6 feet m.s.l.d., occurred in July 1937 and was influenced by backwater from an obstructive railroad bridge. The highest recorded peak flow is 9,020 cfs in June 1972, resulting from Hurricane Agnes. An Intermediate Regional Flood (IRF) would reach 30.9 ft. m.s.l.d. and 10,500 cfs and a Standard Project Flood (SPF) would reach 41.6 ft. m.s.l.d. and 40,800 cfs. Both types of future floods would result in inundation of residential, commercial, and industrial properties. A tentative Comprehensive Development Plan covering future development through 1985 has been developed. Along with this study it can serve as a basis for floodplain regulatory measures. (Diefendorf-North Carolina)
W75-10571

**FLOOD PLAIN INFORMATION: SHABAKUNK CREEK, WEST BRANCH SHABAKUNK AND LITTLE SHABAKUNK CREEKS, MERCER COUNTY, NEW JERSEY.**
Army Engineer District, Philadelphia, Pa.
Prepared for the Mercer County Planning Board and the New Jersey Department of Environmental Protection, October, 1973. 32 p, 9 fig, 34 plates, 8 tab.

Descriptors: *Flood plains, *Flood profile, *Flooding, *Flood forecasting, Obstructions to flow, Flood water, Tributaries, Flood protection, Flood recurrence interval, Flow characteristics, Flood damage, *New Jersey.
Identifiers: Mercer County(NJ), *Shabakunk Creek(NJ), Flood Hazard Area Design Flood(FHADF), Standard Project Flood(SPF).

Located near Trenton, New Jersey, Shabakunk Creek, West Branch Shabakunk Creek, and Little Shabakunk Creek are extensively developed for commercial uses near their mouths and residential use further upstream. More commercial development is projected which will increase the impervious surfaces along the flood plains and act as an obstruction to flood flows creating backwater during a flood. This is further complicated by trees and vegetation and materials stored along the creeks and the obstructive nature of many of the 51 bridges spanning the creeks. Forty bridges are obstructive to the Floodway Design Flood, 46 are obstructive to the Flood Hazard Area design Flood (FHADF) and 48 are obstructive to the Standard Project Flood (SPF). During an SPF water rises at a maximum rate of 1.8 ft/hr after overbank flooding occurs and can remain out of banks for as much as 1 1/2 days. The major floods of record were estimated from gage data on nearby Assunpink Creek in Trenton and are, in three out of four floods, related to hurricanes. Commercial and residential properties along the creeks have been severely damaged by floods in 1938, 1955, 1967, and 1971. Future floods would create even more damage inundating large portions of the Lawrenceville Shopping Center, overtopping roads, bridges and the tracks of the Reading Railroad. The projected FHADF (100 year recurrence interval) has a projected discharge of 2800 cfs and an elevation of 62.7 ft at the confluence of the West Branch with the Shabakunk Creek while the SPF would discharge 5500 cfs and have an elevation of 65.4 ft. generally 2 to 3 ft above the record flood of 1971. (Park-North Carolina)
W75-10572

**FLOOD PLAIN INFORMATION: CATOMA CREEK, VICINITY OF MONTGOMERY, ALABAMA.**
Army Engineer District, Mobile, Ala.
Prepared for the Central Alabama Regional Planning and Development Commission, April 1972. 18 p, 4 fig, 6 tab, 14 plates.

Descriptors: *Flood plains, *Flood control, *Flood damage, *Flood profiles, Flood data, Flood stages, Obstruction to flow, Historic floods, *Alabama, Land use, Planning.
Identifiers: *Catoma Creek(Alabama), *Aalabama River, Montgomery(Alabama), Floodplain management, Intermediate Regional Flood, Standard Project Flood.

Although most of the Catoma Creek floodplain is primarily agricultural or undeveloped, the pressure for future development is high due to its proximity to Montgomery, Alabama. With no existing controls, damage to agricultural and residential sections would be considerable in an Intermediate Regional Flood (IRF) and worse in a Standard Project Flood (SPF). More severe flood conditions on the lower reach of the creek will be produced by flooding of the Alabama River, of which Catoma Creek is a tributary, than from local floods on the Creek itself. Winter and spring are the major flood season, but floods can occure year-round from intense rainfall. Seven bridges and some vegetation create obstructions to flood flow. The U.S.G.S. stream gaging station at the U.S. Highway 331 bridge recorded the highest flood on Feb. 25, 1961, with an elevation of 179.7 ft, m.s.l. and a peak discharge of 48,600 cfs. Peak discharge of an IRF would be 61,000 cfs and of an SPF 104,000 cfs. Measured at the same gaging station, the elevation of an IRF would be 1.2 ft and of an SPF 4.6 f above the 1961 elevation. (Diefendorf-North Carolina)
W75-10574

**FLOOD PLAIN INFORMATION: UPPER RIVER ROUGE, MINNOW POND DRAIN, BELL BRANCH AND TARABUSI CREEK, WAYNE AND OAKLAND COUNTIES, MICHIGAN.**
Army Engineer District, Detroit, Mich.
Prepared for the Water Resources Commission Michigan Dept. of Natural Resources an Southeast Michigan Council of Governments January, 1972. 70 p, 21 fig, 22 plates, 17 tab.

Descriptors: *Flood damage, *Flood forecasting *Flood plains, *Historic floods, Obstructions t flow, Flood profiles, Flood stages, Flood data Planning, Land use, Urbanization, *Michigan.
Identifiers: *Upper River Rouge(MI), Minnow Pond Drain(MI), Bell Branch(MI), Tarabu Creek(MI), Wayne County(MI), Oaklan Creek(MI), Floodplain management, Standar Project Flood(SPF), Intermediate Region Flood(IRF), 50-year frequency flood, Riv Rouge(MI).

Four different water courses northwest of Detroi Michigan, are studied: Upper River Rouge, Mi now Pond Drain, Bell Branch, and Tarabu Creek. Most of the floodplain is limited to agricu tural, recreational and residential uses. Floo caused by heavy rains usually occur at the sam time on all 4 streams. Floods are characterized b rapid rate of rise and short duration. In total the are 52 bridges that can obstruct flow. A tre toward higher river flows and more freque flooding due to urbanization is reflected by ga records kept since March 1958. The flood record of all 4 creeks occurred in June 1968, wit peak discharge of 1730 cfs, only 60 cfs less tha 50-year frequency flood, at Five Mile Road Upper River Rouge. At this point, an Intermedi Regional Flood (IRF) would produce 2210 cfs a a Standard Project Flood (SPF) 5170 cfs. An I would have stages ranging from .3 to 5.9 f greater than June 1968 flood and an SPF wo range up to 14.3 feet higher. The primary purpo of this information is to indicate probable risk recurrent flooding thereby providing the basis planning to minimize vulnerability. All commu ties within the study area have already adop some type of floodplain regulation. (Diefendo North Carolina)
W75-10575

**FLOOD PLAIN INFORMATION: WI BRANCH SUSQUEHANNA RIVER, LYCOMI COUNTY, PENNSYLVANIA.**
Army Engineer District, Baltimore, Md.
Prepared for Lycoming County Planning Com sion, February, 1971. 37 p, 3 fig, 12 plates, 7 tab

Descriptors: *Floods, *Flooding, *Flood profi *Flood data, Flood frequency, Flood forecast Flood flow, Flood peak, Flow, *Pennsylva *Flood plains.

ers: *Susquehanna River(Pa), William-
a), Bull Run(Pa), Lycoming County(Pa),
diate Regional Flood, Standard Project
Susquehanna River.

g on the West Branch of the Susquehanna
Williamsport, Pa., is caused by intense
ead rainfall in the 6,214 square miles of the
ove the study area. Three-fourths of the
uncleared, helping to retain runoff from
ains. Severe flooding can occur in late
nd early spring from heavy rains (40
nnual average) and snowmelt (42 inches
annually). The study area covers 13 miles
West Branch in the Williamsport
itan area, including Moutoursville,
k, Williamsport, South Williamsport and
wn. Bull Run, a small tributary, is
l separately. Much of the lowland near
is still being farmed. Only secondary
d railroad spur lines remain in the flood
ich averages over a mile wide through the
a, since major rail and highway facilities
n either raised, moved, or are protected
or walls. Protection is afforded for the
l area up to the 1936 flood height by
alls, four upstream reservoirs. A county
on regulation including flood plain
ns is being drafted since development is
into unprotected areas. The major flood
d was in March, 1936, with a peak
of 264,000 cfs which covered 3,100 acres
nsport. Future floods of 220,000 cfs peak
at Williamsport gaging station for the In-
e Regional Flood (IRF) and 407, 000 cfs
harge at the same gage for the Standard
Flood (SPF) are predicted. The IRF
would be 1.9 feet lower than the 1936
file while the SPF would be 7.2 feet
the upper limit of the study area. Flood
up to 9-10 ft/sec in the channel and 4
the overbank, together with high water
duration could cause millions of dollars
. (Park-North Carolina)

**FLOOD PLAIN INFORMATION: JAMES RIVER, EAGLE ROCK TO LICK RUN, BOTETOURT COUNTY, VIRGINIA.**
Army Engineer District, Norfolk, Va.
Prepared for Fifth Planning District Commission, June 1971. 39 p, 6 fig, 9 plates, 10 tab.

Descriptors: *Floods, *Flooding, Dams, *Flood profiles, *Virginia, *Flood control, Flood protection, *Flood plains.
Identifiers: *James River(Va), Jackson River(Va), Cowpasture River(Va), Botetourt County(Va), Eagle Rock(Va), Lick Run(Va), Intermediate Regional Flood, Standard Project Flood.

Jackson and Cowpasture Rivers join to form the James River about a mile north of Lick Run and 340 miles above its mouth. The James River flows through a winding channel with flood plain varying from a few hundred to several thousand feet in width in this study reach, its upper 18 miles. Several residential, commercial, and industrial properties as well as rural areas lie in the flood plain. Main flood season is from October through May, but floods with duration varying from several hours to several days can occur in any month due to intense local thunderstorms or tropical storms. Gathright Dam is being constructed 44 miles upstream from Lick Run on the Jackson River as the only flood control for the study area and should reduce floods by 3 feet. The greatest flood occurred in 1877 with a peak discharge of 120,000 cfs. The most recent flood occurred August 20, 1969 as the remains of Hurricane Camille dumped about 27 inches of rainfall on the James Basin in less than 6 hours. With a peak discharge of 58,500 cfs recorded on the James at Lick Run, homes, roads, railroads and bridges were destroyed and high waters in cities and towns caused millions of dollars in damages. With Gathright Dam operating, an Intermediate Regional Flood (IRF) and Standard Project Flood (SPF) on the James River at Lick Run would have peak discharge of 62,300 cfs and 177,000 cfs respectively. An IRF could rise 21.3 ft in 22 hours remaining above bankfull for 57 hours; maximum velocity could be 9.6 ft/sec in the channel (mile 339.7), 3.8 ft/sec overbank (mile 322.0). The SPF could rise 33.8 ft in 36 hours remaining above bankfull 142 hours; maximum velocity could be 15.6 ft/sec in the channel (mile 332.5), 6.9 ft/sec overbank (mile 322.0). (Salzman-North Carolina)

**FLOOD PLAIN INFORMATION: JOHNSON CREEK AND TRIBUTARY, CHESTERFIELD COUNTY, VIRGINIA.**
Army Engineer District, Norfolk, Va.
Prepared for the Chesterfield County Board of Supervisors, September, 1973. 23 p, 8 fig, 11 plates, 4 tab.

Descriptors: *Floods, *Flooding, *Flood control, *Flood forecasting, Flood protection, Flood plains, *Virginia, *Flood plains.
Identifiers: *Johnson Creek(Va), Chesterfield County(Va), Intermediate Regional Flood, Standard Project Flood.

Johnson Creek, located south of Richmond, Virginia, has a drainage area of about 9 square miles at its mouth. Flowing in an easterly direction for 6 miles before emptying into the James River which causes backwater effects in the lower reaches, the creek slopes at an average of 20 feet per mile. Although the channel is clear of vegetation, overbank areas are highly vegetated with sparse development on the flood plains. Increasing population in the nearby Richmond area will create pressure for building on flood plains of Johnson Creek and its tributaries. Because no stream gages exist on Johnson Creek, data was collected from similar streams in the vicinity. Floods, caused by heavy general rainfall, occur during all seasons, and are characterized by rapidly rising flood stages in a relatively short time. Larger and more infrequent floods result from intense local thunderstorms or hurricanes in summer or fall. Natural and manmade obstructions, including bridges and culverts, impede flood flows. Although no flood damage reduction measures exist, flood studies are required before approval of subdivisions and site development plants. The largest flood probably occurred on July 18, 1945. The most recent flood on June 7, 1972 resulted in considerable damage. An Intermediate Regional Flood and Standard Project Flood would result in inundation of the flood plain with peak discharges at the mouth of Johnson Creek of 5,280 cfs and 9,230 cfs respectively. Substantial damage to residential property, streets, roads, utilities would result from either an IRF or an SPF. Plates detail expected water surface elevations and lateral extent of these floods. **A COMPARISON OF METHODS FOR ESTIMATING FLOOD PEAKS ON STREAMS IN MASSACHUSETTS,**
Geological Survey, Boston, Mass.
G. D. Tasker.
Boston Society of Civil Engineers Journal (ASCE), Vol 62, No 1, p 9-19, April 1975. 4 fig, 2 tab, 9 ref.

Descriptors: *Floods, *Flood peak, *Streamflow, *Massachusetts, Flood forecasting, Methodology, Flood frequency, Curves, Flow profiles, Correlation analysis, Evaluation.
Identifiers: *Estimating flood peaks.

Modifications of the Potter method (Potter, 1957) and the Small Basin Study (SBS) method (Johnson and Tasker, 1974) for estimating flood peaks from basin characteristics are used to predict the 50- and 10-year peak discharges at 77 continuous and partial-record gaging stations in Massachusetts. The predicted peaks made by each method are compared with the peak discharge estimated from station frequency curves for each station. Results indicate that, while the random error for both methods is about the same, the modified Potter method systematically predicts peaks which are substantially higher (150 percent) than those estimated from station frequency curves. J. V. B. Wells, and R. E. Fish.
June 1975. 87 p, 3 fig, 1 plate, 19 tab.

Descriptors: *Delaware River Basin Commission, *Delaware River, *Streamflow, *Water management, Reservoirs, Estuaries, Data collections, Monitoring, Water quality, Saline water intrusion, Precipitation(Atmospheric), Water temperature, River basin development.

The 1974 annual report year, December 1, 1973 to November 30, 1974, of the Delaware River Master was a year of excessive precipitation and much above average runoff. Pepaction, Cannonsville, and Neversink Reservoirs of the City of New

York spilled for many months. The annual flow of the Delaware River at Montague adjusted for change in reservoir storage and diversions, was 39% above median and the third highest for the period of record beginning 1940. Diversions and releases from the reservoirs of the city of New York were made within the terms of the Amended Decree of the U.S. Supreme Court, dated June 7, 1954. Diversions by New Jersey through the Delaware and Raritan Canal were within prescribed limits of the Amended Decree. The combined usable contents of Pepacton, Cannonsville, and Neversink Reservoirs on November 30, 1974 was the greatest for November 30 since 1967. Precipitation on the basin above Montague for the 1974 report year was excessive, totaling 52.18 inches, which was the third highest for a report year in the period of record beginning December 1940. Excessive precipitation and runoff during December caused Cannonsville Reservoir to fill and caused the contents of Pepacton and Neversink Reservoirs to increase rapidly. All reservoirs spilled by April. The actual uncontrolled runoff plus actual powerplant releases during the period July 12 to September 2 totaled 98,503 cfs-days. The advance estimate for those days was 77,290 cfs-days. The net cumulative difference between the estimate and actual was -22%. Streamflow in the Delaware River estuary for 8 months of the reporting period retained the salinity front seaward; furthermore, the increased flows were conducive to lowering temperatures during the summer months and raising dissolved-oxygen levels. **ANALYSIS OF A LARGE WATER DISTRIBUTION SYSTEM USING ADVANCED COMPUTER SOFTWARE,**
Orlando Utilities Commission, Fla.
R. E. Savarese, and D. G. Simmons.
Public Works, Vol 104, No 12, p 60-61, Dec 1973

Descriptors: *Water distribution(Applied), *Distribution systems, *Computer models, *Systems analysis, Hydrostatic pressure, Pipelines, Utilities, Simulation analysis, Water demand, Water management(Applied), Computer programs, Design criteria, Florida.
Identifiers: *Orlando(FL), Hardy Cross Network Analysis, 'Water X' Program.

A new computer software system, the 'Water' program, is a vast improvement over the previous 'Hardy Cross Network Analysis' programs. The Orlando, Florida, water distribution system was analyzed without making excess demands on manual or computer time. This large system, including 7 pumping stations and 6 elevated storage tanks, required a basic model of 190 junctions and 500 pipes from 12 to 36 inches in diameter to simulate the system of transportation mains. A model of this size cannot easily be manipulated with manual calculations to examine alternative configurations and flow demands and cost up to $ for an average computer analysis run. The exact accuracy of input data needed to avoid costly false starts was achieved with a checking program which reduced checking time by 90%. The network analysis software was also made 'self-starting'; the user is not required to assign initial estimated flows for each pipe. Non-convergent systems were encountered in which the computer was unable to assign flow and pressure distributions to a hypothetical configuration of water distribution hardware. Simplifying the model aided convergence. This sort of program provides management with testing capability for present and proposed designs. All parameters such as elevated tank heads, flow demand patterns, and pipe sizes can easily be varied to suit the engineer's requirements and then tested by computer simulation. (Herr-North Carolina)

**WATER COLLECTION AND STORAGE DISPERSION APPARATUS,**
F. R. Walcott.
US Patent No 3,890,934, 4 p, 7 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 935, No 4, p 1449, June 24, 1975.

Descriptors: *Patents, *Water storage, *Water supply, *Rainfall, *Wildlife conservation, Rain water, Storage tanks, Equipment.
Identifiers: Module construction.

A modular apparatus is disclosed which collects stores and dispenses rainwater to wildlife. The apparatus includes an elongated storage tank having a central depression into which ducts discharge water. The tank and ducts are composed of panels arranged with respect to each other to provide a path for rainfall water to follow. The tank has slotted rails which receive the edges of the panels thus constructing an enclosure for storage of water gathered via the panelled ducts. A gr

ispensing unit is remotely connected to the e tank by a flexible hose provided with a ntional float valve mechanism. The sing unit includes an opening exposing a ty of the storage water for wildlife drinking es. The modular construction allows the ap- s to be transported to remote areas for in- on and usage. Descriptors: *Canals, *Inland waterways, *Urban runoff, *Florida, Coastal plains, Hydraulic structures, Conveyance structures, Estuarine environment, Mangrove swamps, Bays.
Identifiers: *Cape Coral(Fla), Perimeter canal.

Following a general evaluation of the hydrologic environment in and around Cape Coral, Florida, the discussion turned to the need for and the design of a perimeter canal for conveyance of storm water, It was anticipated such a feature would overcome adverse affects to marine bay ecosystems when freshwater enters tidewater. The perimeter canal was designed to: (1) collect runoff, (2) provide for sediment deposition, (3) encourage salt and fresh water mixing, (4) preserve natural sheet flow to the vegetative zone, (5) remove nutrients, (6) provide recreation and navigation opportunities, and (7) provide a buffer between development and the preserved mangrove zone. Design parameters were presented and a map showed the canal's route. (See also W75-10769) (Jess-ISWS)

Descriptors: *Saline soils, *Artesian aquifers, *Water table, *Drainage, *North Dakota, Pumping, Drawdown, Sandstones, Aquicludes, Glacial drift, Water wells, Slopes, Hydraulic properties, Artesian heads, Observation wells, Hydraulic gradient, Equations, Heat flow, Diffusivity, Piezometers, Curves.

A poorly drained saline area covers 400,000 acres in northeastern North Dakota in the Red River Valley. The upward flow of saline water into a thick overburden of glacial till and lacustrine sediments has created and sustained soil salinity and a high water table. Pumping from the artesian formation reduces hydraulic head in the aquifer, but the response in the glacial till and lacustrine sediments is very slow. It was shown that lowering the water table 2 feet with an aquifer drawdown of 32 feet when the hydraulic diffusivity was 1.44 sq ft/day would require continuous pumping for 5.3 years. The time required to effect hydraulic head redistribution (and water table control) is very dependent upon the hydraulic diffusivity of the overburden. Pump drainage to relieve the high water table and salinity was shown to be feasible even though continuous pumping would be required. A drainage system of 11 wells, pumped at a rate of 500 gallons per minute or less per well, would be adequate and would have an annual cost of $0.34 per acre. (See also W75-10769) (Visocky-ISWS)

Waterloo Univ. (Ontario). Dept. of Civil (Engineering.
N. Kouwen, and A. Harrington.
In: Agricultural and Urban Considerations, in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 273-284, 1974. 6 fig, 1 tab, 4 ref, 1 append.

Descriptors: *Streamflow, *Vegetation effects, *Stream gages, Vegetation, Retardance, Weeds, Grasses, Velocity, Measurement, Laboratory tests, Roughness(Hydarulic), Channel flow, Hydarulics.
Identifiers: *Vegetation stiffness.

When water or air flows over a flexible vegetation, the vegetation will bend and thereby reduce its height. In an open channel which is lined with such vegetation, the roughness of the channel walls and channel bed is very much affected by the flexural rigidity of the vegetation. For instance, when the vegetation is in an erect position it has a very much higher retardance effect than when it is prone, even though the relative roughness may be equal (using the channel bed as the limit of the cross-section). It is therefore important to know under which conditions the vegetation can be expected to be prone or erect. The growth of weeds in rivers and canals is sometimes desirable and at other times cannot be avoided. Problems arise such as

loss of capacity in irrigation or drainage canals and uncertainty in interpolating flows at stream gaging sites infested with weeds. This paper pointed out how previously published work could be applied to practical situations. (See also W75-10769) (Sims-ISWS)
W75-10782

**WELLTON-MOHAWK DRAINAGE AND THE MEXICAN SALT PROBLEM,**
Wellton-Mohawk Irrigation and Drainage District, Ariz.
C. C. Tabor.
In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 285-309, 1974. 9 fig.

Descriptors: *Irrigation, *Drainage, *Water quality, *Arizona, *Mexico, *Colorado River, Mexican Water Treaty, Salinty, Drainage water, Drainage systems, Drainage wells, Water reuse, Groundwater, Subsurface drainage, River systems, Irrigation systems, Drainage practices, Water policy, Governments, Political aspects, Drainage programs.
Identifiers: *Wellton-Mohawk drainage, *Mexicali Valley, *San Luis Valley, Gila Project.

The Wellton-Mohawk Division of the Bureau of Reclamation's Gila Project straddles the Gila River in southwestern Arizona. The project was authorized by Congress after World War II and first delivered water from Imperial Dam on the Colorado River in 1952. It was decided at the time of construction of the irrigation system that the drainage works should be delayed until there was an actual need. Later, a system of pumped drainage was constructed which keeps the groundwater mostly below the root zone of the crops. The drainage water was allowed to flow into the old channel of the Gila River and thence into the Colorado. The first effluent came out of this channel in 1961. Soon after, objections were made by Mexican interests that the salt level of Colorado River water delivered to Mexico at Morelos Dam has been 3000 and 4000 parts per million due to drainage from the Wellton-Mohawk Irrigation and Drainage District, that thousands of acres of farm land in the Mexicali Valley have gone out of production due to this high saline water, and that lack of drainage in Mexicali Valley has nothing to do with the problem. It was argued in this paper that the salt levels are much less than claimed. The decrease in cotton production on Mexican farms was ascribed largely to the arrival of the pink bollworm and to water-logged fields due to poor drainage. Mexico has recently begun a rehabilitation program of canal lining and drainage improvements which should help the situation considerably. Also, there are planned revisions in the U.S. system which should improve the quality of the Colorado River water. (See also W75-10769) (Sims-ISWS)

Descriptors: *Drainage systems, *Drainage engineering, *Tile drainage, *Sewage effluent, *United States, Drainage practices, Engineering Costs, Construction costs, Farm management, Lateral conveyance structures, Pipes, Outlets, Tiles, Filters, Subsurface drainage, Agricultural engineering, Agriculture, Sewage disposal, Irrigation, Drainage, Foreign countries, Specifications.

Answers to a questionnaire received from drainage engineers throughout the United States and various other countries showed that the design and costs of subsurface drainage systems for agricultural drainage vary considerably. In the humid sections of the United States, especially the Midwest, drains are often placed on top of glacial till which is, at times, only 24 inches below the surface. Cohesive soils characterize the profile of the upper two and three feet and a gravel filter usually is not specified. Drain spacings may vary from 30 to 60 feet. Material and construction costs may be as low as 20 cents per lineal foot for a 4-inch drain 30 to 60 inches deep. In the arid west the depth to the drain is normally 5 to 8 feet deep and drains are spaced as close as 75 feet and as far apart as 600 feet. Gravel filters are invariably specified and average material and construction costs vary from 75 cents to $1.75 per lineal foot for a 4-inch drain with a gravel filter. Average installed costs for a 6-inch drain, 6 to 8 feet deep, vary from 85 cents to $5.30 per lineal foot. Drainage engineers are generally receptive to the practice of renovating sewage effluent on agricultural land. (See also W75-10769) (Sims-ISWS)

Identifiers: Implicit loop method, Newton-Raphson method, Iteration, Computation, Operating conditions, Automatic search technique, Nonlinear equations, Remote terminals.

Simulating the performance of water distribution systems on computers helps to improve their design. The two principal phases of a new method--the 'implicit loop method'--for this simulation problem are described. The first phase consists of generating on the computer a network computational model. In the second phase, this computational model is used in an iterative modified Newton method to solve the simulation problem. Detailed information about the method is given from which the reader can produce a computer program. An implementation of the method is described which uses the interactive capability afforded by remote terminals. The implicit loop method for analyzing water distribution networks is very flexible and readily adaptable to a variety of networks, designs, and operating conditions. The method requires a minimum of input data, is particularly well-suited to digital computations, and is exceptionally well-suited to provide input error diagnostics. All this makes the use of interactive computing techniques with remote terminals practical, reliable, and highly cost effective. (Bell-Cornell)

Descriptors: Reservoirs, *Reservoir operation, *Flood control, Economics, *Recreation, *Operating costs, Storage capacity, *Kentucky, *Benefits, Water supply, Water level fluctuations.

A methodology was developed for determining an optimum set of reservoir operating rules specifying the monthly allocation of storage space based on the example of Rough River Reservoir, a Corps of Engineers project in Breckinridge and Grayson Counties, Kentucky, and assuming this multipurpose reservoir provides flood control, water supply, and recreation. The operating rules were derived by the method of marginal analysis which uses as its criteria achievement of maximum net benefits from the available storage capacity. Benefit relationships were derived for each use. The variation of flood control benefits with available flood storage was determined from Corps of Engineers stage-damage curves and statistical analysis of the historical storms in the area. The variation of water supply yield with the allowable water surface fluctuation within the reservoir was determined by using statistical properties of past stream-flow to synthesize a month-by-month operation of the reservoir. Recreation benefits as they varied with available storage were determined for five levels of annual visitation (up to twice the present value) by sub-dividing use among three activity types and estimating how each type of use would be affected by a fluctuation of water level. ## 4B. Groundwater Management

**HYDRAULIC BEHAVIOUR OF THE CHALK AQUIFER IN THE YORKSHIRE WOLDS,**
Institute of Geological Sciences, London (England). Dept. of Hydrogeology.
S. S. D. Foster, and R. I. Crease.
The Institution of Civil Engineers Proceedings, Part 2, Research and Theory, Vol 59, p 181-188, March 1975. 4 fig, 10 ref.

Descriptors: *Groundwater, *Aquifer characteristics, *Aquifer testing, Groundwater availability, Hydrogeology, Transmissivity, Specific yield, Pumping, Water table aquifers, Wells, Streamflow, Flow augmentation, Cores, Laboratory tests, Permeability, Flow, Hydraulic properties.
Identifiers: *Chalk Aquifer, England, Delayed yield.

The groundwater hydraulics of the Chalk Aquifer in the Yorkshire Wolds were investigated in detail by a major hydrogeological pumping test and associated techniques in the Etton area and by the analysis of groundwater level and river flow data from the West Beck catchment. Nationally, the aquifer accounts for about 15% of all water supplies and current interest focuses on its potential for low-flow augmentation. Laboratory tests on core samples showed very low intergranular permeability and, therefore, flow was believed to be primarily through fissures. Early time-drawdown data from observation wells showed the effects of delayed yield. Analysis of late data gave transmissivity and specific yield values of about 1000 sq m/day and 0.005, respectively. Limited groundwater recession data in the West Beck catchment had a log-linear relationship similar to that of river flows. Considerable caution is required of preliminary investigations and extrapolation from pilot operations for river augmentation schemes. A high transmissivity, low specific yield, water-table aquifer will have a more rapid response than most unconfined systems. Actual

groundwater flow rates will also be relatively fast, a significant factor in the spread of pollutants, should they reach the water table. (Visocky-ISWS)

New Mexico State Engineer Basic Data Report, 1975. 72 p, 32 fig, 38 tab, 36 ref.

Descriptors: *Groundwater resources, *Water level fluctuations, *Basic data collections, *New Mexico, Observation wells, Aquifer characteristics, Pumping, Water utilization, Groundwater recharge, Maps, Hydrographs.

Water levels were measured in a network of about 1,600 observation wells in 35 areas located within nine major surface-water drainage basins in New Mexico. The measurements were made in January or February 1973 and reflect water-level changes with measurements made in January or February 1972. Maps showing well locations and water-level changes for 1972 are included for most areas. The water-level data are used in the U.S. Geological Survey and the State Engineer of New Mexico in evaluating the groundwater resources of the State. (Woodard-USGS)

Geological Survey, Reston, Va.
S. W. West, and W. L. Broadhurst.
Available from Supt. of Documents, GPO, Washington, D.C. 20402 - Price $1.75. Professional Paper 813-D, 1975. 39 p, 21 fig, 2 tab, 154 ref.

Descriptors: Texas, New Mexico, Mexico, Colorado, *Groundwater resources, *Regional analysis, *Rio Grande River, Water supply, Water utilization, Aquifer characteristics, Water yield, Water quality, Withdrawal, Irrigation, Hydrologic data, Maps, Hydrographs, Appraisals, Economics, Evaluation, Water resources development, Surface-groundwater relationships, Watershed management, Legal aspects, Underground storage, Underground waste disposal.
Identifiers: *Rio Grande Region.

The Rio Grande is an interstate and international stream which begins in high mountains of Colorado, flows across New Mexico, and forms the boundary between Texas and Mexico. Annual precipitation on the region is about 86 million acre-feet; however, all but 4 million acre-feet is returned to the atmosphere by evapotranspiration. The groundwater reservoirs contain an aggregate of 5,800 million acre-feet of fresh and slightly saline water in storage, which could be withdrawn through wells. In contrast, the surface reservoirs have a combined storage capacity of only 18 million acre-feet. Withdrawal of groundwater in 1970 was 2.7 million acre-feet, of which 88% was used for irrigation. The region appears to offer several possibilities for utilizing underground space for purposes other than the withdrawal of water, such as waste disposal, artificial recharge, water-quality control, and development of geothermal energy. Descriptors: *Groundwater resources, *Regional analysis, *Ohio River, Water supply, Water utilization, Aquifer characteristics, Water yield, Water quality, Hydrologic data, Withdrawal, Groundwater recharge, Appraisals, Planning, Water resources development, Watershed management, Underground storage, Underground waste disposal.
Identifiers: *Ohio River Region.

Groundwater in the Ohio Region is a large, important, and manageable resource that should have a significant role in regional water development. On the basis of a comparison of groundwater withdrawals with estimated groundwater recharge, the groundwater resources probably will not be used at full potential under existing development plans. Annual groundwater use (1960) by municipalities and rural residents was about 1,000 million gallons per day. Average annual regional groundwater recharge is about 35,000 mgd. Therefore, base-year (1960) municipal and rural groundwater use is only about 3% of recharge. Annual regionwide groundwater use (1965) by industry also is only about 3% of recharge. Total potable groundwater available from storage in the outwash and alluvial aquifers in the Ohio River valley and the subbasins is about 23,000 billion gallons. This is about four times the flood-control storage of all Ohio Region Corps of Engineers reservoirs constructed, under construction, or in advance planning as of July 1965. Approximately 85,000 billion gallons of potable groundwater is available from storage in aquifers other than the outwash and alluvial aquifers. (Woodard-USGS)

In: Agricultural and Urban Considerations in rigation and Drainage; Selected Papers from Irrigation and Drainage Division Speciality C ference, Fort Collins, Colorado, April 22-24, 1 American Society of Civil Engineers, New Y p 179-194, 1974. 7 fig, 4 tab.

Descriptors: *Conjunctive use, *Irrigat *Nebraska, Water resources developm Groundwater, Surface waters, Water man ment(Applied), Climatic data, Average, Land Crops, Water quality, Wells, Irrigation wells.

There are 116,700 acres being irrigated by sur water in the loessial uplands of the south cer area of Nebraska between the Platte Republican Rivers. After approximately 30 y of surface irrigation and a rising groundw table, the trend appears to be toward a stable dition. This stable sub-surface condition e through The Central Nebraska Public Power Irrigation District's development of 270 gro water wells and other improvements. The consequential contribution to the present c tion has been the expansion and developme more than 2400 private wells. Conjunctive u water is essential for maximum benefit from supplies, surface and sub-surface, but p management of both supplies is also essential Central District, with the help of a consultin gineering firm, has developed a groundw model to predict the effect of changes (suc canal lining and pipelines) in the surface system on the groundwater resource. The major problem remaining is development equitable revenue base for the surface water system that includes not only the surface wa rigators but also the groundwater irrigators re ing recharge benefits from the surface water system. **THE LOXAHATCHEE - A RIVER IN DISTRESS, SOUTHEAST FLORIDA,**
Geological Survey, Miami, Fla.
H. G. Rodis.
Central and Southern Florida Flood Control District report, 1973. 9 p.

Descriptors: *Saline water intrusion, *Florida, *Streams, Environmental effects, Land clearing, Construction, Canals, Land development, Watershed management, Investigations, Surveys, Evaluation, Streamflow, Regulated flow, Groundwater levels, Water quality control, Pesticides, Nutrients, Path of pollutants, Water pollution sources.
Identifiers: *Loxahatchee River(Fla).

Before the turn of the century, the northwest fork of the Loxahatchee River in southeast Florida sustained a flow of fresh water to the sea and its narrow flood plain was covered by a dense river-forest of sub-tropical trees and plants. Today, with land development, digging of canals, and water control practices, salt water is encroaching upstream and has transformed the lower reach of this river into an arm of the sea. The upper reach too has changed, having practically disappeared into a maze of canals and ditches and a quiltwork of farms and homes. Only the middle reach now remains virtually unchanged. The middle reach of the Loxahatchee River is threatened with conversion to a brackish-water environment because diminishing fresh water flow is permitting salt water to move farther and farther upstream. The river requires a continuous flow of 50 cfs at the beginning of its middle reach to retard further upstream movement of the sea. This flow is valid only if groundwater inflow along the middle reach does not fall below 1971-73 levels. In addition to maintaining a minimum flow, the flow should be low in pesticides, nutrients, or other toxic materials. Otherwise, because of the deleterious effects of these substances on plant life, much of the benefit of salinity control will be mullified. (Woodard-USGS)

R. C. Heath.
Available from NTIS, Springfield, Va 22161 as PB-243 642, $5.25 printed copy, $2.25 in microfiche. Water-Resources Investigations 9-75, May 1975. 98 p, 49 fig, 6 tab, 43 ref.

Descriptors: *Land clearing, *Agricultural engineering, *Swamps, *Drainage practices, Environmental effects, Overland flow, *North Carolina, Estuaries, Groundwater, Hydrology, Lakes, Geology, Water wells, Water level fluctuations, Land subsidence, Channeling, Farm management, Water quality, Oysters, Shrimp.
Identifiers: Albemarle Sound(NC), Pamlico River(NC), Dismal Swamp(NC), Yorktown Formation(NC), Castle Hayne Limestone(NC), Pungo River Formation(NC), Suffolk Scarp(NC).

Extensive agricultural land clearing and drainage operations are changing the hydrology in a 650 sq mi area of the Albemarle-Pamlico region in North Carolina. The affected area is part of the 1,634 sq mi peninsula that lies between Albemarle Sound on the north and Pamlico River on the south. The artificial drainage system being constructed will probably result in only a slight modification of the natural annual evapotranspiration, overland runoff, and groundwater discharge, but will likely result in several important problems. First, changes in the water quality of the sounds and estuaries resulting from the rapid runoff of storm waters may prove harmful to the fishery resources. Second, lowering of the water table may cause relatively rapid subsidence of the land surface in an irregular pattern in the extensive areas underlain by thick peat deposits as a result of biochemical oxidation, peat fires, and wind. I. Douglas.
Hydrology Symposium, Armidale, Australia, 1975. The Institution of Engineers, Australia, Preprints of Papers, p 61-64, May 1975. 4 fig, 13 ref.

Descriptors: *Flood discharge, *Urbanization, *Urban runoff, *Sediment load, *Storm runoff, Sediment discharge, Watersheds(Basins), Rainfall-runoff relationships, Tropical regions, *Australia, Graphical methods, Sediment transport.
Identifiers: Malaysia(Kuala Lumpur), New South Wales.

Analysis of storm event sediment transport using dimensionless sediment concentration graphs reveals contrasts between runoff and sediment yield from urban areas and that from adjacent rural lands. For a catchment in New South Wales (Australia) which is 15% urbanized, the contasts are marked for short-duration local storms, but not for major rainfall events. In the vicinity of Kuala Lumpur (Malaysia), a tropical area 40% urbanized, the contrast is so great that even in extreme events urban runoff and sediment yields are greater than those from rural areas. In estimating the hydrologic effects of urbanization, account must be taken of the original character of the ground surface and the proportion rendered impermeable by urbanization. (CSIRO)

THE EFFECTS OF URBANIZATION ON FLOODS OF DIFFERENT RECURRENCE INTERVAL,
University Coll., London (England). Dept. of Geography
G. E. Hollis.
Water Resources Research, Vol 11, No 3, p 431-435, June, 1975. 3 fig, 1 tab, 20 ref.

Descriptors: *Floods, *Urbanization, *Urban runoff, *Runoff, Hydrology, Land use, Time of concentration, Surface runoff, Urban hydrology, Annual peak discharge, Peak discharge, Permeability, *Flood recurrence interval, Watersheds(Basins), Watershed management.

Urbanization does not affect floods of different recurrence intervals equally. Impervious cover such as roofs and roads prevents infiltration into the soil and speeds runoff. The effect is greatest in small floods which may be increased by a factor of 10 or more. L. B. Leopold (Hydrology for Urban Land Planning, 1968) has shown that urban-induced increases in peak discharges of annual floods can range from 1.5 up to 6 times the discharge of a similar undeveloped basin. But the effect diminishes as the size of the flood increases, since during prolonged rainstorms a rural watershed can become saturated and respond hydrologically as if it were an impervious urbanized area. Leopold's methodology is extended to derive a family of curves for the relationships between the increase in flood peaks following a given amount of urbanization, the percentage of the basin paved, and the flood recurrence interval. Data from 15 empirical studies were tabulated and graphed. The results show that paving less than 5% of the drainage area has negligible effect on floods with return intervals of 1 year or more; complete urbanization which results in at least 30% paving of the basin may double the discharge of the 100-year flood; and a flood with recurrence interval above 150 years is not materially affected by urbanization. WATERSHED BEHAVIOR AFTER FOREST FIRE IN WASHINGTON,
Forest Service (USDA), Wenatchee, Wash. Forest Hydrology Lab.
J. D. Helvey.
In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Specialty Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 403-422, 1974. 6 fig, 4 tab, 16 ref, 1 append.

Descriptors: *Forest fires, *Watersheds(Basins), *Washington, Streamflow, Snowpacks, Precipitation(Atmospheric), Gaging stations, Soil moisture, Sedimentation, Temperature, Hydrographs, Evapotranspiration, Vegetation, Debris avalanches, Channel erosion, Geology, Road construction, Lumber, Lumbering.
Identifiers: *Entiat Experimental Forest(Wash), *Cascade Range, Shade reduction, Debris torrents.

More than 120,000 acres of forested land was burned over in north-central Washington in the summer of 1970. Included in the area was the Entiat Experimental Forest, where hydrologic measurements began in 1959. This area, located on the east slope of the Cascade Range, varies in elevation from 2000 to 7000 feet above sea level. Slope gradients average about 50%, but slopes over 90% are quite common. For the first time in this area, hydrologic data collected from forested watersheds in their natural condition could be compared with records collected after the vegetation was destroyed by fire. Hydrologic behavior in 1972 was in sharp contrast to pre-fire conditions, but was confounded by several factors. The effects of a single factor could not be determined. For example, the effect on runoff of reduced evapotranspiration caused by destruction of the vegetation by fire was confounded by abnormally high precipitation. Other complicating factors included logging road construction, logging over snow, and intense summer rainstorms. Studies are underway to monitor trends of vegetation development and to relate vegetation density to soil movement and water yield. In this way it is hoped to evaluate the effectiveness of various treatments on hydrologic behavior of these burned-over watersheds. (See also W75-10769) (Roberts-ISWS)

WATERSHED MANAGEMENT PROBLEMS AND OPPORTUNITIES FOR THE COLORADO FRONT RANGE PONDEROSA PINE ZONE: THE STATUS OF OUR KNOWLEDGE,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
H. L. Gary.
Research Paper RM-139, March 1975. 32 p, 24 fig, 4 tab, 70 ref.

Descriptors: Forest management, *Range management, Vegetation effects, *Ponderosa pine zone, *Watershed management, Conifers, Land use, Planning, Coniferous forests.

The east flank of the Continental Divide consists largely of open timber stands and grasslands. Soils erode easily after abuse. Precipitation ranges from 15 to 20 inches, about two-thirds from high-intensity storms from April to September. Guidelines are provided for maintaining satisfactory watershed conditions. The 3- to 5-inch water yields are comparatively small in contrast to yields of 12 to 25 inches from the high-altitude subalpine forests, but are important to development along the Front Range. Watershed management practices can be expected to provide practical alternatives for increasing water supplies. (Forest Service)

entifiers: Atomic absorption spectrometry.

e atomic absorption spectrometry of manganese s studied with carbon tube atomizers. Among rious inner diameters of carbon tubes small res gave higher sensitivity, but large bores gave gher reproducibility. A fairly linear calibration rve was obtained in the range of 1-6 times 10 to minus 10th power g of manganese with injec-n volumes of 5 microliters. The detection limit s 1.5 times 10 to the minus 11th power g, and the ative standard deviation was 3.5%. In 40-fold ounts, few salts interfered, but there were con-erable interferences from 400 and 4000-fold ounts. Manganese in natural waters was deter-ned by extracting it into diisobutyl ketone as the thyldithiocarbamate; the amounts found lay in range 0.5-33 ppb. (Witt-IPC)

niv fur Fischerei Wissenschaft, Vol 25, No p 63-74, September 1974. 4 fig, 1 tab, 18 ref.

Descriptors: *Analytical techniques, *X-ray fluorescence, *X-ray analysis, *Methodology, *Metals, *Spectroscopy, Iron, Copper, Zinc, Manganese, Cobalt, Fish, Absorption, Fluorescence, Pollutant identification.
Identifiers: *Bioaccumulation.

Fishes from the river Elbe were analyzed for manganese, iron, cobalt, copper and zinc using flameless atomic absorption spectroscopy and x-ray fluorescence. The analysis was based on a selective separation and enrichment of the metals by chelate exchanger chromatography. In element determinations, the metal traces were enriched by complex precipitation and transferred into an ideally measurable form. (Katz)

**MARINE POLLUTION BIOASSAY BY SEA URCHIN EGGS, AN ATTEMPT TO ENHANCE ACCURACY,**
Doshisha Univ., Kyoto (Japan). Biological Lab.
N. Kobayashi.
Publications of the Seto Biological Laboratory, Vol 21, No 5/6, p 377-391, December 1974. 7 tab, 6 ref.

Descriptors: *Bioassay, *Bioindicators, *Water quality control, *Sea water, Aging(Biological), Fertilization, Embryonic growth stage, Pollutants, Water pollution effects, *Pollutant identification.
Identifiers: *Sea urchin eggs.

To improve the sensitivity of methods for marine pollution bioassay aged sea urchin eggs were utilized. The eggs were left in test water for some hours before they were inseminated; and then rates of fertilization, first cleavage, gastrulation and some anomalies in the test water were observed. Various abnormalities, i.e. the retarded formation of the fertilization membrane or the lack of one polyspermy, irregular cleavage and development, occurred more sensitively on aged eggs; and this seems to provide a better technique for bioassay of marine pollution. Hours to insemination should be limited within the range in which the eggs follow the normal development in ordinary, unpolluted sea water, since abnormalities occur in polluted water. They were 9 hours in Pseudocentroutus, 6 hours (warmed) in Hemicentrotus and 3 hours in Anthocidaris. The effects of heavy metals and other chemicals upon the aging of the eggs are not significant. (Katz)

National Taiwan Univ., Taipei. Inst. of Oceanography.
S. S. Jeng, G. S. Wang, Y. W. Huang, and J. L. Lain.
Journal of the Fisheries Society of Taiwan, Vol 3, No 1, p 29-32, 1974. 1 fig, 1 tab, 4 ref. English abstract.

Descriptors: *Heavy metals, *Cadmium, *Copper, *Lead, *Mercury, *Nickel, *Zinc, *Water pollution effects, Shellfish, Fish, Tissue analysis, Environmental effects, Harbors.
Identifiers: *Kaohsiung Harbor(Taiwan), Republic of China.

Cadmium, copper, lead, mercury, nickel and zinc concentrations in fish and shellfish caught in Kaohsiung harbor in February, 1974 were studied. Cadmium, mercury, lead and zinc concentrations were around ordinary levels. However, the contents of copper and nickel in the fish and shellfish were higher than in those from other areas. This may indicate that the waters in Kauhsiung harbor were contaminated by copper and nickel discharged from the factories. (Katz)

**MULTICHANNEL TOXICANT INJECTION SYSTEM FOR FLOW-THROUGH BIOASSAYS,**
National Water Quality Lab., Duluth, Minn.
D. L. DeFoe.
Journal of the Fisheries Research Board of Canada, Vol 32, No 4, p 544-546, April 1975. 1 fig, 2 ref.

Descriptors: *Design, *Bioassay, Construction equipment, Costs, Instrumentation, *Measurement.
Identifiers: *Flow-through bioassays, *Water-metering cells, Falling water.

A mechanical injection system needing little maintenance is described which offers a dependable and flexible method for maintaining multiple toxicant concentrations in flow-through bioassays. Falling water from a series of water metering cells similar to those of a proportional diluter, activates a series of mechanical syringe injectors. The system dispenses equal amounts of toxicant dispersants (solvents, wetting agents or additives) to all toxicant concentrations and to a dispersant control and allows changing unlimited toxicant concentrations independently of each other. **ELECTRON MICROSCOPE AUTORADIOGRAPHY OF KIDNEY AFTER ADMINISTRATION OF PB-210 IN MICE,**
Tokyo Univ. (Japan). Dept. of Public Health.
M. Murakami, and K. Hirosawa.
Nature, Vol 245, No 5421, p 153-154, September 21, 1973, 1 fig, 8 ref.

Descriptors: *Lead, *Rodents, *Cylological studies, Distribution, *Radioisotopes, Animal physiology, Analytical techniques, Microscopy, Electron microscopy, *Pollutant identification, Metals.

The precise localization of PB 210 in some organelles in the tubular epithelial cells of the mouse kidney was demonstrated by the use of electron microscopic autoradiography. Male mice were injected intraperitioneally with 0.5 ml of solution of RaD in 0.1% acetic acid and killed 30 minutes after injection. RaD contains PB 210, Bi 210, and Po 218 in radioactive equilibrium. Alpha-emission of Pb 210 results in the appearance of silver grains in the emulsion. Counting the grains on 20 tubules showed that in the epithelial cells, more than half of the grains were found on mitochondria and about one third on the cytoplasm, half of which were associated with cytoplasmic membranes. A few grains were found on the nuclei of the epithelial cells. The results indicated that lead is accumulated in the mitochondria and in the cytoplasm as soon as 30 minutes after its administration. Grains were found on the various kinds of membrane and on the cytoplasm free of membranes. Thus, the cytoplasm as well as the membranes seem to be involved in the incorporation and transport of lead. Science, Vol 183, No 4129, p 1094-1096, March 15, 1974. 2 tab, 15 ref.

Descriptors: *Cadmium, *Rodents, *Metabolism, Animal physiology, Laboratory tests, Toxicity, Protein, *Biochemistry, Cytological studies, *Pollutant identification.

Daily intraperitoneal injection of cadmium chloride (1 milligram per kilogram) for 45 days enhanced gluconeogenesis as evidenced by significant increases in the activities of liver and kidney cortex pyruvate carboxylase, phosphopyruvate carboxylase, hexosediphosphatase, and glucose-6-phosphatase, the quartet of key, rate-limiting enzymes involved in the biotransformation of non-carbohydrate precursors into glucose. Whereas cadmium treatment decreased the level of hepatic glycogen, the concentration of blood glucose and urea was significantly elevated by this heavy metal. Discontunation of the heavy metal treatment for 28 days, in rats previously injected with cadmium for 45 days, failed to restore the observed biochemical alterations in hepatic and renal carbohydrate metabolism to control values. Evidence indicates that cadmium augments the glucose-synthesizing capacity of liver and kidney cortex and that various metabolic changes persist even after a 4-week period of withdrawal from exposure to the heavy metal. Illinois Univ., Urbana. School of Chemical Sciences.
D. F. S. Natusch, J. R. Wallace, and C. A. Evans, Jr.
Science, Vol 183, No 4121, p 202-204, January, 1974. 1 fig, 2 tab, 13 ref. NSF (GI 31605) and (GH 33634).

Descriptors: *Trace elements, *Toxicity, *Industrial wastes, *Fossil fuels, *Air pollution, Cadmium, Lead, Laboratory tests, Analytical techniques, Spectroscopy, Arsenic compounds, Pollutant identification, Path of pollutants.

This study was designed to test the theory that combustion characteristics at the particle source determines why many toxic elements are most concentrated in the smallest ambient airborne sources. The tests were conducted in reference to fly ash derived from coal-fired power plants. The elements arsenic, antimony, cadmium, lead selenium and thallium were most concentrated in the smallest respirable particles emitted from coal-fired power plants. It was concluded that these elements, or their compounds are probably volatilized during combustion and preferentially absorb or condense onto the small particles which can most easily pass through conventional control equipment. Since no authenticated soil reference sampl
mercury analysis were available, an evaluat
a new circulation apparatus for atomic abso
was performed with three sample prepa
methods using natural samples. One o
methods involved digestion and wet oxid
which employed a nitric and sulfuric acid m
for digestion followed by potassium permang
oxidation. The second method, which could
ly be adapted for the collection and determi
of Hg in air or other gases, involved acid dige
wet oxidation, and collection in potassiu
manganate. The third method - oxygen flask
bustion - involved burning a pelleted sampl
perforated tantalum basket in an oxygen
flask containing a collecting solution to abso
Hg evolved. In the analysis, the usual bu
technique for Hg removal from the sample
tion was replaced by a procedure in which th
cury in the reduced sample was parti
between a fixed volume of air and the liquid
in a closed vessel by agitation. The air wa
blown through an absorption cell for me
ment. Absorption peak-heights were some 3
greater than those obtained with a bubbling s
without recirculation. For 1g samples, the a
cal range was 0.01-0.5 ppm. (Pulliam-Vander

**EFFECT OF DIETARY SELENIUM ON GLUTATHIONE PEROXIDASE IN THE CHICK,**
California Univ., Davis. Dept. of Food Science and Technology.
S. T. Omaye, and A. L. Tappel.
Journal of Nutrition, Vol 104, No 6, p 747-753, June 1974. 3 fig, 3 tab, 20 ref.

Descriptors: *Toxins, *Lipids, Path of pollutants, *Animal metabolism, *Animal pathology, Environmental effects, Metals, *Pollutant identification, Water pollution effects.
Identifiers: *Selenium.

Tissues of chicks fed a diet deficient in selenium demonstrated decreased glutathione (GSH) peroxidase activity. GSH peroxidase activity was dose-related to the level of selenium; the specific activity increased as a logarithmic function of the dietary selenium level. Essentially, there was no difference between the activity of GSH peroxidase in various tissue soluble fractions from chicks fed equal gram-atoms of selenium as sodium selenite and as selenomethionine. Regression analysis of pooled data for GSH peroxidase and GSH reductase activities in tissues of chicks fed 0.1 ppm selenium indicated a linear relationship between the two enzymes. These data supported the hypothesis that GSH peroxidase and GSH reductase are metabolically related. GSH reductase activity was not related to dietary selenium levels. The implications of this study were that GSH peroxidase is dependent upon selenium for activity and that it also is a part of a detoxification system for peroxides. (Pulliam-Vanderbilt)

**STUDIES ON THE METABOLISM OF CHLOROPHENOLS IN FISH-III ISOLATION AND IDENTIFICATION OF A CONJUGATED PCP EXCRETED BY GOLDFISH,**
Hyogo Prefecture Fisheries Experiment Station, Kobe (Japan).
H. Akitake, and K. Kobayashi.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 41, No 3, p 321-327, March 1975. 4 fig, 1 tab, 15 ref.

Descriptors: *Organic compounds, *Freshwater fish, Analytic techniques, *Biochemistry, Laboratory tests, Methodology, *Phenols, *Pollutant identification, Water pollution effects.
Identifiers: *Goldfish, Carassius auratus, *PCP, Excretion, Phenolic compounds, Chemical breakdown, Conjugation, Detoxification mechanism.

The amount of phenolic compounds (PCP) in goldfish, Carassius auratus, was less than that lost from the PCP-medium during culture. Most of the PCP excreted was in a conjugated form, pentachlorophenyl-sulfate, accompanied with a small free-form amount. The study suggested that fish possess a detoxification mechanism for chlorophenols which involves sulfate conjugation. (See also W70-08375 and W70-08379) (Katz)

Bulletin of the Japanese Society of Scientific Fisheries, Vol 41, No 4, p 449-458, April 1975. 4 fig, 2 tab, 12 ref.

Descriptors: *Killifishes, Laboratory experiments, Organic compounds, *Tracers, Fish physiology, *Absorption, Metabolism, Analytical techniques, Chromatography, Aquaculture, Equations, *Pesicide residues, Radioactivity techniques, Analytical techniques, *Pollutant identification.
Identifiers: *Medaka, *Anesthetic(Piscine), Residue analysis, 2-Amino-4-phenylthiazole, Excretion, Bioaccumulation.

Residue analyses on 3H-2-amino-4-phenylthiazole were performed in medaka (killifish, Oryzias latipes). This fish was selected because of its ready application in radiotracer experiments and its marked and unique ability to detoxify the piscine anesthetic, 2-amino-4-phenylthiazole to its N-hexuronyl conjugate. The absorption/excretion balance showed an average 102% recovery indicating that the excretion treatment effectively exhausted the residue from medaka. The half-life for retention of this compound and its N-hexuronyl conjugate in the fish body was approximately 12-15 hours. The fates of both the anesthetic and its N-hexuronyl conjugate in the fish body were determined separately in a time course survey using TLC radiography. Plots for the excretion of the major product, i.e. the conjugate, and the anesthetic per se produced two crossing exponential curves suggesting that there are two compartmentations of both the conjugate and the anesthetic per se in medaka. A mathematical simulation of the residue was also described. (Katz)

H. Shimma, and Y. Shimma.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 40, No 11, p 1179-1186, November 1974. 2 fig, 4 tab, 11 ref.

Descriptors: *Polychlorinated biphenyls, *Sharks, *Saline water fish, *Growth stages, *Bioassay, *Lipids, Fish physiology, Organic compounds, Pollutant identification, Water pollution effects.
Identifiers: *Spotted sharks, Mustelus manazo, Bioaccumulation, *Tokyo Bay, Liver, Flesh, Yolk lipid, Biosynthesis, *Japan.

Lipids were extracted successively with 2:1 mixture of n-hexane and chloroform-methanol from flesh, liver and other viscera of 7 spotted sharks, Mustelus manazo taken from Tokyo Bay. One shark contained embryos. The contents and composition patterns of chlorobiphenyls were examined. Among immature fish, a linear relationship between body weight and PCB content was observed. PCBs found in the liver consisted mainly of hexa- and hepta-chlorinated compounds. In parent fish, the PCB content in flesh tended to increase, possibly with age. In embryos, the PCB content of yolk lipid was twice that of body lipid and similar to the Chloroform-methanol extracted lipid from parent fish liver. (Katz)

Descriptors: *Water analysis, *Heavy metals, *Water pollution, *Rivers, *Australia, Analytical techniques, *Trace elements, Chemical analysis, Copper, Cadmium, Lead, Toxicity, Aquatic life.
Identifiers: Melbourne(Vic), Yarra River, Maribyrnong River.

A survey of levels of copper, lead and cadmium in the Yarra and Maribyrnong Rivers (Victoria, Australia) was undertaken cooperatively by three independent laboratories, each with expertise in the analysis of trace elements in water. The overall mean values obtained indicate that the metals occur at levels not expected to produce toxic effects on any but the most sensitive of aquatic organisms. Variations in results obtained by the three laboratories are reported and discussed, with recommendations for standard procedures and precautions. (CSIRO)

The new type sampler described, combine
best features of grab and composite sampler
is a valuable technique for evaluating indu
wastes and storm flows because it provides
by-hour profiles of waste conditions which c
correlated with production schedules or sp
events. All 24 samples are available for sp
analysis if it is necessary. Simple or flow-p
tioned composites for any desired period c
made to suit the needs or goals of a water q
control program. Sequential composites
possible self-cancelling factors such as pH, a
and alkalinity, or color variations, as well
nificant factors which would be lost by dilu
a 24-hour composite or missed in a single
sample. Analysis of the individual sequentia
posites can aid in determining the effect of
of spills as well as establishing when they oc
and how long they lasted. Data acquired from
ysis can also be useful in determining whe
particular condition is the result of a sing
cident or continual small discharges. The se
tial composite is made up of a series of freq
collected samples composited and retained
dividual containers each of which repres
sub-period within the overall sampling p

**A GRAVITY-FLOW COLUMN TO PROVIDE PESTICIDE-LADEN WATER FOR AQUATIC BIOASSAYS,**
Environmental Protection Agency, Gulf Breeze, Fla. Gulf Breeze Environmental Research Lab.
P. W. Borthwick, M. E. Tagatz, and J. Forester.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 6, p 183-187, February 1975. 1 fig, 3 tab, 5 ref.

Descriptors: *Pesticides, *Bioassay, *Laboratory tests, Technology, *Design, Chlorinated hydrocarbon pesticides, Methodology, Solvents, Carriers, Solubility, Pollutant identification.
Identifiers: *Mirex, *Gravity-flow column.

A column containing granular pesticide, bait, or inert material coated with pesticide achieves realistic concentrations of pesticides in bioassay water without using carrier solvents that may affect results. Mirex was introduced into flow-through aquatic bioassay systems without a solvent by means of a gravity-flow column containing mirex bait. Fluctuations in the mirex concentration within individual tanks were not significant. The system is being used in toxicity and uptake tests. (Katz)

**ORGANIC MATTER IN NATURAL WATER AND WATER TREATMENT,**
New Hampshire Univ., Durham. Dept. of Chemistry.
J. H. Weber.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 915, $3.25 in paper copy, $2.25 in microfiche. Presented at New Hampshire Water Works Association Meeting, September 5, 1974. 12 p, 1 fig, 1 tab, 2 ref. OWRR A-035-NH(1).

Descriptors: *Organic matter, *Chemical properties, *Water treatment, Chelation, Metals, Ions, Potable water, Color, Ozone, New Hampshire.
Identifiers: Alum, Activated charcoal, Oyster River(N.H.), Metal chelates.

An overview of rivers and lakes, including the origin and general nature of their dissolved and undissolved material is given. The origin of organic material is mainly decaying vegetative matter mixed with or on top of soil. Chelating agents and metal chelates, the nature of organic matter in water, and isolation of organic matter from water are considered. Effects due to the presence of chelating agents in natural water are: dissolving of precipitated metal ions; precipitation of normally dissolved metal ions. Chelated metal ions are not removed by precesses that remove metal ions. One of several reasons to remove organic matter before domestic water usage is aesthetic as people do not like to drink colored water, although the amount or organic matter that causes the yellow is not considered toxic. The organic matter forms metal chelates. Chelating agents might prevent the removal of very toxic matals like lead, mercury, and cadmium. Treatment for organic matter includes application of alum, filtering through activated charcoal, and utilization of ozone. The chemical nature of organic matter was determined by processing more than six tons of water to isolate 30 g of organic matter from the Oyster River, New Hampshire. (Jones-Wisconsin)

**ADSORPTION AND DEGRADATION OF CHLORBROMURON IN SOIL,**
Agricultural Research Service, Stoneville, Miss. South Weed Science Lab.
K. E. Savage.
Weed Science, Vol 21, No 5, p 416-420, 1973.

Descriptors: *Adsorption, Toxicity, *Water pollution sources, Soils, Chromatography, *Microbial degradation, Biodegradation, Cucumbers, Pollutant identification.
Identifiers: *Chlorbromuron, Cucumis-sativus, *Freundlich equation, Phytotooxicity.

The adsorption-desorption equilibria of chlorbromuron (3-(4-bromo-3-chlorophenyl)-1-methoxy-1-methylurea) in soil conformed to the Freundlich equation. Values of the constants, k and n, ranged 4.2-12.3 and 1.2-2.5, respectively, in 8 soils. No significant linear correlation was detected between the Freundlich k values and soil texture, organic-matter content, pH, or water-holding capacity. Degradation studies were conducted using 14C-carbonyl-radiolabeled chlorbromuron in soil incubated at 18 or 32C, with and without prior autoclaving, and with and without glucose enrichment. Degradation was enhanced by the higher temperature and glucose amendment, and it was retarded by autoclaving. Thin-layer chromatography indicated no accumulation of the monomethyl or monomethoxy derivative of chlorbromuron in any of the treatments. Chlorbromuron degraded rapidly in the incubation studies. Rapid loss of phytotoxicity was also noted in a greehouse study with cucumber (Cucumis sativus L. 'Explorer') bioassay. Phytotoxicity from 4 ppmw (micro-g/g dry plant weight) chlorbromuron had diminished to a very low level after 12 wk.--Copyright 1974, Biological Abstracts, Inc.

Revue Internationale D'Oceanographie Medicale, Vol 35-36, p 79-90, 1974. 1 fig, 2 tab, 22 ref.

Descriptors: *Polychlorinated biphenyls, *DDT, *Pesticide residues, *Fish, *Birds, *Dieldrin, *Path of pollutants, Pesticides, Absorption, Chlorinated hydrocarbon pesticides, Water pollution sources, Food webs, Gulls, Pollutant identification.
Identifiers: *Po River(Italy), Tissue analysis, Bioaccumulation.

Residues of lindane, dieldrin, DDT and its metabolites and PCB found in fish and birds captured in the Po delta during 1972 were reported. In fish, chlorinated pesticides and PCB were always less than 1 ppm in the muscle while the liver contained up to 4 ppm of DDT and its metabolites. Gobius paganellus contained 12 ppm of PCB. The sea-gull (Larus ridibundus) showed the highest levels of DDT and its metabolites (4 ppm in the muscle and liver) while the common tern had the highest level of PCB (7.9 ppm in the muscle and 8.6 in the liver). The levels of chlorinated hydrocarbons in the muscles of fish were lower than the tolerance limits for public health (5 ppm) established in the U.S. (Katz)

**OCEAN POLLUTANTS POSE POTENTIAL DANGER TO MAN,**
R. J. Seltzer.
Chemical and Engineering News, Vol 53, No 8, p 19-20, February 24, 1975.

Descriptors: *Water pollution effects, Oceans, *Waste disposal, Organic compounds, Model studies, Pollutants, Water pollution sources, *Path of pollutants.
Identifiers: *Hexachlorobenzene, Transuranic elements, Synthetic organic chemicals.

Studies are being conducted to assess materials and technologies and their potential impacts on ocean environments. Certain marine pollutants pose no threat at present levels, while others should be carefully monitored. While the oceans should play a useful role in waste disposal, their potential for diluting harmful effects is limited. A transport model to estimate the mass flow and ultimate fate of pollutants is being developed. Six groups of materials have been chosen for case studies: transuranic elements; synthetic organic chemicals; waste materials, sludges, and sediments dumped or discharged into the ocean; metallic wastes; medicinal wastes; and marine litter. The critical parameters were: rate of release into the environment; persistence in the environment; concentration factors for ocean compartments (such as estuaries or surface films) and bioaccumulation; and toxicity, both long and short range. Two materials of major concern are transuranic elements from nuclear weapons tests and hexachlorobenzene. The latter is the only synthetic organic chemical examined which seems to present a problem. Hexachlorobenzene is resistant to degradation, disperses easily through the food web, and has resulted in wildlife losses worldwide. Its sources are pesticides and wastes from factories manufacturing other chlorinated hydrocarbons. Doubts still remain about the impact of low-molecular weight halogenated hydrocarbons and tetracyclines and of aromatic hydrocarbons. (Prague-FIRL)

Sea Technology, Vol 16, No 1, p 29-30, January 1975.

Descriptors: Oceans, *Water pollution effects, Aquatic life, *Oil, Climates, Investigations, Metals, Surface waters, Exploration, Mineralogy, *Water pollution sources, Organic compounds.
Identifiers: *Minerals location.

Exploration by the Living Resources, Seabed Assessment, Environmental Forecasting, and Environmental Quality programs of the International Decade of Ocean Exploration has been conducted in the past two years, and further work is planned through 1977. Studies investigated the location of natural oil accumulations as well as areas of pollution and the effects of pollutants on marine organisms. The goal of these studies is the understanding of the role of the ocean in weather and climate and knowledge of circulation within the ocean. It was suggested that heavy metals, chlorinated hydrocarbons, and the water-soluble fractions of petroleum hydrocarbons be used to study pollution effects on aquatic life. Data now complete from the Geochemical Oceans Sections Study provide quantitative bases for knowledge of stirring and mixing processes of the sea and exchange of material between deep and surface waters. **TAR POLLUTION OF SIERRA LEONE BEACHES,**
Fourah Bay Coll., Freetown (Sierra Leone). Inst. of Marine Biology and Oceanography.
W. Okera.
Nature, Vol 252, No 5485, p 682, December, 1974. 1 fig, 2 ref.

Descriptors: Oceans, *Plastics, Ships, Pollutants, Marine life, *Africa, *Water pollution sources, Water pollution effects.
Identifiers: *Sierre Leone, West Africa, Pelagic tar, Tankers, *Tar pollution.

Pelagic tar and plastic wastes have been found in parts of the Pacific and Atlantic oceans. Extensive and considerable fouling of the sandy beaches of Sierra Leone, West Africa, by tar lumps has been observed from June 1973 to July 1974. The extent of current pollution suggests that the whole Sierra Leone coastline, and perhaps those of flanking countries as well, may be subject to frequent tar pollution, proabably originating from the heavy, offshore traffc of tankers and ships. During ebb tide, at Lumley Beach, tar lumps and other debris are deposited on the sand in a series of crescent-shaped aggregations by the receding waves. The lumps are inhabited by a variety of marine organisms such as colonies of small goose barracles, and ghost crabs (Ocypode spp.). (Prague-FIRL)

Descriptors: *Metals, *Trace elements, *Ocear *Air pollution, Sampling, On-site data collectio Manganese, Nickel, Cobalt, Chromium, T Lead, Zinc, *Pollutant identification, *Path of p lutants.

Data on the average trace metal composition aeolian particulates from the lower atmosphere various major wind systems over the World Oce are presented. For the elements, Mn, Ni, Co, C Cr, V, Ba, and Sr, the enrichment factors we reasonably close to unity, i.e., these elements we not significantly enriched in average low le marine aeolian particulates. In contrast, the e ments Sn, Pb, and Zn were enriched in the aeol particulates, relative to average crustal materi by one order of magnitude, even when geograp cal variations are smoothed out by taking a wor wide average. It was concluded that Sn, Pb, a Zn are being released preferentially into marine mosphere (from sources which probably incl the activities of man) and are concentrating, re tive to average crustal material, in low le aeolian particulates. **CHARACTERIZATION OF CADMIUM U TAKE BY PLANT TISSUE,**
California Univ., Davis. Dept. of Agronomy Range Science.
J. M. Cutler, and D. W. Rains.
Plant Physiology, Vol 54, No 1, p 67-71, Ju 1974. 2 tab, 7 ref, 22 ref.

Descriptors: Grains, *Cadmium, *Adsorpti *Metabolism, Plant physiology, Zinc, Copp Mercury, Cytological studies.

The uptake of cadmium by excised root tissu barley was investigated with respect to kinet concentration and interactions with various tions. The role of metabolism in Cd absorption examined using a range of temperatures, ana bic treatment, and chemical inhibitors. The upt and distribution of Cd in intact barley plants also determined. A large fraction of the Cd ta up by excised barley roots was apparently result of exchange adsorption and was displa by subsequent desorption with unlabeled Cd, Cu or Hg. Another fraction of Cd which could be displaced by desorption in unlabeled Cd thought to result from strong irreversible bin of Cd, perhaps on sites of the cell wall. The f tion of the Cd taken up beyond that by exch adsorption by fresh roots was a linear functio temperature, and inhibited by conditions of oxygen and by the presence of 2, 4-dinitrophe It was concluded that this fraction of Cd ent excised barley roots by diffusion. Diffusion, v followed by sequestering, probably accounts the accumulation of Cd observed in intact ba plants. (Jernigan-Vanderbilt)

criptors: *Bed load, *Dispersion, *Sediment port, *Model studies, Bottom sediments, ments, Stochastic processes, *Path of pollu-, Streamflow, Channels, Mathematical ls, Mathematical studies, Movement, Pollu-, Hydrology.

nalysis based on the concentration distribu-function described the dispersion of con-ated particles released simultaneously from a e in the bed of a stream with steady, uniform Lagrangian probabilistic model, in which the ment of each particle is described as an al-e sequence of steps and rest periods was It was shown that the concentration distribu-was initially highly skewed and became essively symmetrical with time so that it be approximated by a Gaussian curve. The udinal location of the peak of the distribution function advanced slightly faster than the movement of the mass center of the distribution curve, so that after a sufficiently long time the peak approached the mass center. Also presented was a simplified procedure for deriving an excellent approximation to the envelope of the family of distribution curves parameterized by time, even when the shape factor r takes on nonintegral values. This yielded curve that is always uniformly lower than the envelope with the deviation between the two curves diminishing with time. For a dimensionless time scale greater than five, the error incurred was 5% and less, depending upon the value of r. (See also W75-10507) (Sims-ISWS)

**PREDICTION OF TRIFLURALIN DIFFUSION COEFFICIENTS,**
Agricultural Research Service, Stoneville, Miss. South Weed Science Lab.
L. E. Bode, C. L. Day, M. R. Gebhardt, and C. E. Goering.
Weed Science, Vol 21, No 5, p 485-489, 1973, Illus.

Descriptors: *Diffusion, *Herbicides, Forecasting, Mathematical models, *Soil moisture, Temperature, Soils, Soil temperature, *Path of pollutants, Water pollution sources.
Identifiers: *Trifluralin diffusion coefficients.

In the range of 4.4-49C, there is an exponential relationship between temperature and trifluralin (a,a,a-trifluoro-2,6-dinitro-N,N-dipropyl-p-toluidine) diffusion coefficients. Diffusion is low in airdry soil for all temperatures. It increases to a maximum value when the soil has 8-15% w/w (weight in weight) soil moisture content and then decreases steadily as moisture content increases. When the air-filled fraction of soil void space is reduced below approximately 40% v/v (volume in volume) by either compression or addition of moisture, diffusion begins to decrease. An equation was developed to predict trifluralin diffusion coefficients from a factorial experiment with 7 soil moisture contents, 5 soil temperatures and 2 bulk densities. Diffusion coefficients ranged 3.8 x 10 to the minus 11th power sq cm/sec-2.8 x 10 to the minus 6th power sq cm/sec. Fifteen terms were required in the prediction model to describe accurately the response surface of trifluralin diffusion coefficients. When the equation it was possible to predict trifluralin diffusion coefficients for any combination of measured soil parameters as long as they were represented by the range of the variables used in the experiment.--Copyright 1974, Biological Abstracts, Inc.

T. J. Cloud, Jr., and K. W. Stewart.
J Kans Entomol Soc. Vol 47, No 3, p 379-396, 1974, Illus.

Descriptors: *Texas, *Mayflies, Aquatic insects, Invertebrates, Aquatic drift, Rivers, Bioindicators, Path of pollutants.
Identifiers: Baetis-sp, *Brazos River(Tex), Heptagenia-sp, Isonychia-sicca-manca, Neochoroterpes-mexicanus, Tricorythodes-sp.

An investigation into the drift-ecology of the mayfly populations of the Brazos River, a Southwestern USA river, was conducted from April, 1972-Feb., 1973. Bi-monthly drift samples were used to delineate the nocturnal periodicities and seasonal fluctuations of 6 spp. (Neochoroterpes mexicanus, Tricorythodes sp., Baetis sp., Caenis sp., Heptagenia sp. and Isonychia sicca manca), 3 of which are new and as yet undescribed. Highest levels of behavioral drift, expressed in drift density units, occurred during the night of the summer sample dates. The drift of exuviae seems to be an accurate indicator of mayfly emergence in the Brazos River.--Copyright 1974, Biological Abstracts, Inc.

**PHOSPHORUS IN PERCOLATES FROM MANURED LYSIMETERS,**
Guelph Univ. (Ontario). Dept. of Land Resource Science.
D. G. Bielby, D. A. Tel, and L. R. Webber.
Canadian Journal of Soil Science, Vol 53, No 3, p 343-346, 1973.

Descriptors: *Corn(Field), *Farm wastes, *Phosphorus, *Lysimeters, Percolation, Poultry, Water pollution sources.

The quantities and concentrations of soluble P in the percolates from lysimeters with applications of liquid poultry manure over a 3-yr period are reported. Three corn plants were grown on each lysimeter, and the group of lysimeters was surrounded by corn plants to avoid an oasis effect. Aliquots of the percolates were obtained when the accumulated volume was equivalent to or greater than a 1-cm depth over the surface area of a lysimeter. The amount of P in the percolates during the periods prior to planting and during the growing season was very low, trace-0.003 g/lysimeter. The largest amount of P, 0.003 g, was found in the percolates from nonmanured lysimeters prior to the planting period. This loss would be equivalent to 0.05 kg/ha. In all treatments, the addition of water after harvest removed more P than from the nonirrigated lysimeters. The water was added in small amounts several times/wk. A pulse-type of input contributed to a greater movement of P than a continuous input. Over the 3-yr period, the P added in the 4 treatments was equivalent to 50, 408, 1240 and 1590 kg/ha. During the 3 yr the percolates contained the equivalent of 0.35, 0.65, 0.38 and 0.35 kg of P/ha for the 4 treatments, respectively; and the corresponding concentrations of P in the percolates were 0.029, 0.057, 0.033 and 0.034 mg/l. Applied P tends to remain immobile in a soil. Attenuation of the P would occur as the water moved through the subsoil.--Copyright 1974, Biological Abstracts, Inc.

**A RIVER-QUALITY ASSESSMENT OF THE UPPER WHITE RIVER, INDIANA,**
Geological Survey, Indianapolis, Ind.
W. J. Shampine.
Available from NTIS, Springfield, Va 22161 as PB-243 739, $4.75 printed copy, $2.25 in

microfiche. Water-Resources Investigations 10-75, 1975. 68 p, 28 fig, 12 tab, 28 ref.

Descriptors: *Water quality, *River basins, *Indiana, *Chemical analysis, *Water pollution sources, Nutrients, Pesticide residues, Biological communities, Municipal wastes, Industrial wastes, Reservoirs, Thermal stratification, Bottom sediments, Land use, Sewage effluents, Path of pollutants.
Identifiers: *Upper White River(Ind).

The White River in Indiana can be subdivided into five distinct river-quality sections. Section 1, above Winchester, drains a rural area and is affected by agricultural land use, although the river quality generally is good. Section 2, between Winchester and Muncie, is affected by urbanization at Winchester and Muncie. The river quality generally is good, although stretches near the cities occasionally have problems. Section 3, Muncie to Anderson, is polluted by urban effluent. Section 4, Anderson to Indianapolis, is further polluted (particularly at Anderson), but the river tends to recover considerably at Indianapolis, and becomes relatively clean. Section 5, below Indianapolis, is polluted. In October 1972 the nitrogen load increased from 5.45 tons per day above Indianapolis to 18.43 tons per day below the city. Ten micrograms per kilogram of DDD, 20 of chlordane, and 20 of polychlorinated biphenyls were extracted from sediments in the White River below Indianapolis. The median coliform bacteria count below Indianapolis is 360,000 colonies per 100 millilitres of water. The only benthic invertebrates found in the White River below Indianapolis are pollution-tolerant species, and very few fish are found. Conditions are similar, but to a somewhat lesser degree, below Muncie. (Woodard-USGS)

**PROBLEMS RELATED TO WATER QUALITY AND ALGAL CONTROL IN LOPEZ RESERVOIR, SAN LUIS OBISPO COUNTY, CALIFORNIA,**
Geological Survey, Menlo Park, Calif.
R. H. Fuller, R. C. Averett, and W. G. Hines.
Available from NTIS, Springfield, Va 22161 as PB-243 466, $4.25 printed copy, $2.25 in microfiche. Water-Resources Investigations 47-74, February 1975. 46 p, 18 fig, 6 tab, 34 ref.

Descriptors: *Water pollution sources, *Algae, *Algal control, *Reservoirs, *California, Water quality, Hydrologic data, Rainfall, Streamflow, Sediment transport, Water yield, Sediment yield, Dissolved oxygen, Water temperature, Limnology, Nuisance algae, Chemical analysis, Diatoms, Nutrients, Copper sulfate, Water quality control.
Identifiers: *Lopez Reservoir(Calif).

Lopez Reservoir in San Luis Obispo, Calif., is a multipurpose impoundment that was filled during a 30-weed period following a series of intense storms during the winter 1968-69. The reservoir is used for flood control, water supply, and recreation. At full pool Lopez Reservoir has a surface area of 974 acres, a maximum depth of 145 feet, and a shoreline of 22 miles. Nuisance algal blooms have been a frequent occurrence in the reservoir since the first summer after filling (1969). Dominant bloom species include the blue-green alga Anabaena unispora, the diatoms Stephanodiscus astraea and Cyclotella operculata, and the green algae Pediastrum duplex and Sphaerocystis schroeteri. During a bloom of A. unispora in May 1972, the total cell count at the lake surface was almost 100,000 cells per millilitre of water. Lopez Reservoir is thermally stratified from April until November. Dissolved-oxygen stratification closely parallels the thermal stratification. Anoxic conditions begin to develop in mid-May, and by early July all water below a depth of 40 feet is oxygen deficient. The application of copper sulfate to reduce algal production has met with little success. Possible application rates and methods of determining application rates based upon water chemistry are presented. (Woodard-USGS)

Identifiers: *Anchovy, *Sardine, Engraulis encrasicholus, Sardina pilchardus, Bioaccumulation, Tissue analysis, *Adriatic Sea.

Levels of mercury, copper, nickel, silver, cadmium and lead were determined in various tissues of the northern Adriatic anchovy, Engraulis encrasicholus, and sardine, Sardina pilchardus throughout a seven month fishing season. The highest concentrations of nickel, silver, cadmium and lead occurred in the skin and gills, with little interspecific differences and no unusually high values. The highest concentrations of mercury and copper occurred in internal tissues, with anchovy showing markedly higher concentrat than the sardine. Total mercury concentratson anchovy muscle ranged from 70 to 215 nanogr per gram wet weight, concentrations 2-4 ti greater than in the same or similar anchovy spe off northwestern Africa, southeastern Un States, and California. **A THEORY OF THE MASS TRANSPORT PREVIOUSLY DISTRIBUTED CHEMICALS A WATER-SATURATED SORBING POR MEDIUM: 4. DISTRIBUTIONS,**
Oregon State Univ., Corvallis.
F. T. Lindstrom, and L. Boersma.
Soil Science, Vol 119, No 6, p 411-420, June 1 1 fig, 4 tab, 12 ref, append. NIEHS Grant ES 40.

Descriptors: *Mass transfer, *Chemicals, *Po media, *Boundary processes, Inflow, Sorp Dispersion, *Distribution, Numerical anal Leaching, Saturated flow, Velocity, Equat Convection.
Identifiers: Sorbed phase, Free phase, P system.

A quantitative analysis of a mass transfer pro of chemicals in porous media was presented specific problem considered was that where t flow boundary has an initial zero concentrati receives an inflow of chemical concentrati sub O for a period of finite duration T sub 1, which the inflow continues with water of chemical concentration. Free and sorbed chemical concentration distribution equa were first obtained for dispersion during the period O less that t less than or equal to T during which the chemical enters the soil. solutions were presented in the form of single volution integral expressions obtained by La transform techniques. This resulting distrib became the initial concentration distributio the subsequent leaching process during the period T sub 1 less than t less than or equal to 2. Equations were developed which describ free and sorbed phase chemical distribu resulting from the leaching process. Solutio both sets of equations were obtained by num quadrature techniques. A typical example w played. The scheme that was presented is adaptable to a repeating or 'pulsed' sy Periodic application of a fertilizer, followed rigation, is an example of such a system. **OIL IN THE SEA.**
The Dock and Harbour Authority, Vol 55, N p 323, January, 1975.

Descriptors: *Oil pollution, *Oceans, Urb noff, Oil industry, Water pollution sources, pollution effects, Microorganisms, Biode tion, Organic compounds, *Oil.
Identifiers: Petroleum hydrocarbons.

e United States National Research Council has epared a report on petroleum hydrocarbons en- ing the world's oceans. Of six million tons of se hydrocarbons that enter the world's oceans year, about 35% come from transportation ac- ties, including tanker bilges, drydocks, ter- nals operations, and accidents; 31% from river l urban runoff; 13% from coastal refineries and nicipal and industrial wastes; 10% from at- spheric fallout; 10% from natural seepage; and % from offshore oil operations. One year's ut of oil is thought to exist on the open sea as ating specks and lumps. Tar masses have ap- red in formerly unpolluted areas worldwide, ginating primarily from tanker washings and e discharges. Reliable information on the rates iodegradation of oil by microorganisms in the ans was not available. (Prague-FIRL)

ER POLLUTION PROBLEMS AS- IATED WITH CONTROL OF STACK GAS SSION,
onal Lime Association, Washington, D.C.
Lewis.
roceedings of the 27th Industrial Waste Con- ce, May 2-4, 1972, Purdue University, yette, Indiana, Engineering Extension Series 41, Part 2, p 1089-1092. 1 tab.

riptors: *Waste pollution sources, *Air pollu- *Cleaning, *Gases, Metallurgy, Powerplants, Sulfur compounds, Fly ash, *Path of pollu- Waste disposal, Economics, Carbon diox-

ifiers: *Wet scrubbers, *Stack gas emissions, culate matter.

The water pollution potential resulting from the clean up of stack emission gases and particularly the clean up of gases from metallurgical smelters and coal burning powerplants is discussed. While pollutants in the gas of coal burning powerplants and metallurgical smelters are generally referred to as particulate matter, oxides of nitrogen, sulfur dioxide, and carbon dioxide, they may also contain many elements which volatilize in one form or another and terminate in the aqueous scrubbing medium. Few of the many technologies advanced from the treatment of gases from these particular sources have been attempted commercially; some are operating successfully due mainly to local circumstances where economics or end uses are favorable. Few, if any, treatment technologies have adequately described or provided means for the prevention of water pollution from the clean up of these gases. A possible solution is that a water treatment facility be designed into every stack gas clean up system using an aqueous medium for scrubbing which would include sludge dewatering for permanent storage or use in construction materials. An environmental clean up program based on economic efficiency cannot generate a dollar profit in today's societal structure. Emission and effluent standards may have to be revised to meet an economically acceptable solution. (Auen-Wisconsin)

**THE SOURCE AND SUPPLY OF VIRGIN LUBES,**
Sun Oil Co., Philadelphia, Pa.
D. W. Twomey.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 9-16, 1974. 6 fig.

Descriptors: *Oil, *Oil wastes, *Oil industry, Waste disposal, Oil pollution, Industrial wastes, Recycling.
Identifiers: *Lube oils, Re-refining.

Manufacturing lube oils is expensive in both capital and operational cost; relatively few barrels of crude oil within a refinery system are made into lube--only 3-6% in a fully integrated refinery. The supply of lubes is not easily or inexpensively increased by additions to existing plants while the demand for lubes has grown rapidly during a period of declining capacity. Two solutions are offered for meeting national objectives of an adequate supply for the domestic market and maintaining foreign markets for profit and trade balance: the addition of domestic capacity to produce additional lubes; and, the conservation of lubes. A large percentage of lubes can be recovered. These include railroad engine lubes, transformer oil, industrial hydraulic oil, circulating oil for lubrication, industrial gear oil, emulsifiable cutting oils, and gas absorption oil. These oils can be economically recovered for secondary use because they exist in large quantities in relatively few locations and the large volume has already created a disposal problem. The pressures of supply, cost and proper disposal should work together to make reconditioning or re-refining a large and valuable business. (See also W75-10739) (Orr-FIRL)

**WASTE OIL IN MARYLAND: A POLLUTANT OR A RESOURCE,**
Maryland Environmental Service, Annapolis.
M. T. Long.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 43-54, 1974. 2 ref.

Descriptors: *Oil, *Oil wastes, *Waste disposal, *Oil industry, Water pollution sources, Industrial wastes, Fuels, Maryland, Industrial wastes.

A study was performed by the Maryland Environmental Service and the EPA to determine the amounts and characteristics of waste oils in Maryland and to design a program for the collection, transportation, processing and use of these oils. The design constraints were that all of the waste oils generated in the State be accepted, that the majority of the waste oils be converted into fuel, that present technology be used and that environmental protection be strongly considered. An estimated 18.5 million gallons of waste oil were generated in Maryland in 1972. Maryland has the technology to feasibly collect all of the waste oils produced in the state, to process these oils into fuel oils and to dispose of non-processable oils and residues in an environmentally acceptable way. Such a waste oil recovery and reuse program is outlined. Mathematical modeling of collection and transportation systems, preliminary plant design, market analysis and the constraints imposed, indicate that the program can be self-supporting at volumes greater than 30 mgy. The proposed program would have several advantages including alleviation of fuel oil shortages during the winter months, reduction of environmental damage to the water, land, and air resources of Maryland, reduction of high volumes of waste oil spills and the attendant cost of clean-up, prevention of waste of a resource, and reduction of maintenance cost in sewers and municipal treatment plants. **WASTE LUBRICATING OIL CHARACTERISTICS--DO THEY VARY GEOGRAPHICALLY, SEASONALLY, AND WITH ORIGIN,**
American Petroleum Inst., New York. Task Force on Utilization of Waste Lubricating Oils.
R. C. Carter.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 73-90, 1974. 14 tab.

Descriptors: *Oil, *Oil wastes, *Waste disposal, *Oil industry, Industrial wastes, Water pollution sources, Laboratory tests.
Identifiers: Lubricating oils.

The American Petroleum Institute is studying the characteristics of waste lubricating oils as the first phase of a project to determine how to make economic use of these used oils. The raw analytical data from samples representing winter driving conditions from thirteen representative locations throughout the continental U.S. are presented. The second phase of the project will involve burning tests to demonstrate the feasibility of burning small ratios of waste fuel oil blends without significant impacts on the environment. The continental U.S. was divided into five geographical areas--Pacific Coast, Rocky Mountain, Plains States, East Coast, and Mid-West Rural--then from each of the first four of these zones three cities or city areas were selected to have samples taken from it. Water content, flash point, ASTM distillation to 450 F, sulfated residue, aluminum, barium, calcium, copper, iron, lead, magnesium, phosphorus, sodium, zinc, total bromine, and total chlorine, and sulfur contents were determined on the hydrocarbon layer. **OILY BILGE FROM COMMERCIAL VESSELS,**
Environmental Quality Systems, Inc., Rockville, Md.
R. Waller.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 185-199, 1974. 4 tab.

Descriptors: *Oily water, *Ships, *Water pollution sources, *Oil pollution, Pollutant identification, Fuels, Oil wastes, Recycling, Port authorities, Minnesota.
Identifiers: *Bilge water, Re-refining industry, Duluth(Minn).

A grant has been provided to the Seaway Port Authority of Duluth (Minn) to characterize the sewage, bilge, ballast, dunnage and garbage from the various vessels that enter Duluth Harbor. The major marine waste categories include: sanitary sewage; other sewage; garbage/refuse; dunnage; ballast water; cargo loss; tank washing; and, spilled cargo. Over sixty samples of sanitary sewage, bilge, ballast, garbage and dunnage were taken from commercial vessels entering Duluth Harbor. The oil content and total volume of bilge waters varies considerably between vessels. Diesel-driven vessels appear to generate a bilge water that can be quite high in oil content although the volume of bilge water generated is less than that from steam-driven vessels. The bulk of the data presented is for vessels with no onboard oily waste control system. Waste oil re-refiners expecting to handle bilge water must be prepared to accept a highly variable feedstock. (See also W75-10739) (Orr-FIRL)
W75-10752

**SHIPYARD PROBLEMS WITH OILY WASTES,**
A. C. K. Clark.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 201-205, 1974.

Descriptors: *Ships, *Oil wastes, *Oily water, *Waste disposal, Recycling, Water pollution sources, Facilities, Waste treatment, Port authorities.
Identifiers: *Shipyards, Re-refining.

The receiving and disposing of oily wastes from ships by shipyards has been an opportunity for economically alert shipyards. The shipyards could profit doubly by this -- charging ships a fee for offloading their oily wastes and then saving on the cost of purchasing fuel by separating and then burning the oil from the ships. Receiving slop barges were towed out to ships at anchorage or at piers, to be loaded with slop oil and towed ashore for disposal of the wastes. Powered barges with centrifuges received many thousands of gallons of oil wastes, pumping the centrifuged water back into the harbor. Shipyard settling tanks separated the remaining oil and water; the residual water was pumped into the harbor. However, current regulations place limitations on the amount of oily water released to a harbor and on the amount of harmful emissions from the burning of fuels. The regulations provide that no oil or oily water may be dumped into the harbor that would create sheen on the surface. Equipment to reduce the amount of residual oil in oily wastes to such low levels is not currently available therefore, alternate methods of slop disposal must be found. The quantities of wastes received by shipyards may seem small to the oil re-refining industry, but they are large problems for shipyards that do not have suitable disposal facilities. Such facilities are economically non-viable for individual shipyards to build and therefore should come under the control of port authorities. (See also W75-10739) (Orr-FIRL)
W75-10753

**CHARACTERISTICS OF OIL POLLUTION IN AND AROUND U.S. WATERS,**
Coast Guard, Washington, D.C.
P. W. Van Voorhis.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 207-224, 1974. 6 fig, 5 tab, 8 ref.

Descriptors: *Oil pollution, *Coast Guard regulations, Pollutant identification, *Oily water, *Oil wastes, Water pollution, Oil-water interfaces, Oil spills, Water pollution sources, Federal Water Pollution Control Act.
Identifiers: Chemical Hazard Response Information System(CHRIS), 1972 Federal Water Pollution Control Act Admendments.

One of the effects of the 1972 amendments to the Federal Water Pollution Control Act was to extend and strengthen the U.S. Coast Guard's regulatory authority for the control of oil and hazardous substances discharged into U.S. coastal waters. The oil pollution problem in the U.S. today, and the Coast Guard's growing program to combat it are discussed. The main emphasis is on the oil discharges which have occurred in or upon U.S. waters between 1970 and 1972, concentrating on frequency, volume, causes and characteristics, as well as the problems and expense associated with removal. The Coast Guard has been developing a pollution response program which involves field personnel organized to effectively respond to a pollution incident, district and Headquarters coordinating and administrative elements, and equipment to be utilized by field personnel in containment and removal activities. The Chemical Hazard Response Information System (CHRIS) was developed and placed in operation during the spring of 1974. CHRIS provides field personnel with the necessary information to make an effective response to discharges of hazardous polluting substances. The Coast Guard's research and development program has been working toward the development of equipment to be utilized in offshore and fast current oil discharges. Research has also been aimed toward reducing the quantity of oil released, controlling the spread of released oil, and removing oil from water. (See also W75-10739) (Orr-FIRL)

**RUNOFF OF OILS FROM RURAL ROADS TREATED TO SUPPRESS DUST,**
Edison Water Quality Research Lab., N.J.
F. J. Freestone.
In: Proceedings of the International Confere
on Waste Oil Recovery and Reuse, February
14, 1974, Washington, D.C., Information Trans
Incorporated, Washington, D.C., p 375-393, 1
6 fig, 7 tab, 3 ref.

Descriptors: *Oil, *Rural areas, Metals, Lead,
noff, Roads, *Oil pollution, Oil wastes, *Path
pollutants.
Identifiers: Oil runoff, Lead pollution, Dust
pressants.

Waste crankcase oils applied to rural roads in
United States for the purpose of dust control c
tain about one percent by weight of lead c
pounds. In Hunterdon County, New Jersey, wh
roads are oiled twice yearly, two rural roads w
examined to determine whether or not oil lea
the roads. Of the oil applied, it was estimated
about one percent remains in the top inch of r
surface material and that oil penetration below
top inch is minimal. Oil may leave the road du
wet weather by flotation from wet road surf
material; lead also leaves the road surface with
noff. A considerable amount of lead--about
mg/kg--may be associated with dust particles
the road and may be carried by winds to c
taminate crops and fields adjacent to the road
is not possible to quantify the amount of oil run
However, the ecological consequences of ru
oil and its accompanying heavy metals such
lead need to be studied further. (See also W
10739) (Prague-FIRL)

Recharge, Groundwater, Groundwater movem
Water pollution, Water pollution control, Ma
matical models, Leaching, Subsurface drain
Groundwater potential, Flow, Permeability,
water movement, Pit recharge, Induced inf
tion.

An investigation was made of steady-flow re
gular recharge pits into two dimensional flo
gions using a numerical method of analysis. I
case of single layer systems, the effects o
dimensions of the flow region, pit size, hydr
gradient and anisotropy on total flow rates
the pit were investigated. In addition, the poss
ty of reducing pit leakage by means of a
permeability lining in the recharge pit wa
vestigated. For the particular two-dimens
systems studied, it was found that the overall
rate increases with increasing hydraulic grad
but in a slightly non-linear manner. By varyin
width and depth of the recharge pit it was pos
to determine that optimum pit dimensions
beyond which only slight improvement in
rates can be accomplished by increasing pit di
sions. For an isotropic, single layer system
results of this work suggest that these opti
dimensions are attained when both the depth
the width of the pit are 0.1 to 0.2 times
thickness of the flow region. In the third di
sion, the recharge pit is in the form of a long
or channel. The results imply that in arti
recharge operations, considerable costs cou
avoided by not designing recharge pits with di
sions greater than the optimum values. O
other hand, in the case of landfill operations
results suggest that increasing the depth a
width of the pit will not necessarily cause pr

l increases in the volume of leachates enter-
ie groundwater system. (See also W75-10769)

exponential equation which describes the
in salinity of the pumped effluent from an
r initially filled with saline water of higher
tration that the replacement irrigation deep
ation water. Assuming that the pumping
ion in the Wellton-Mohawk Division will
ue in a pattern similar to that from 1966
h 1972, the average salinity of the drainage
t will decrease exponentially. Salt concen-
measurements made in the Wellton-
vk main conveyance channel are the best
of data for determination of the weighted
e salinity effluent conditions. These data
sed to predict future average salinity values
llton-Mohawk drainage flows. A system's
s study has been made and a 'Drainage
ions Scheduling Model' developed. This
natical model should be helpful in develop-
ture pumping schedules. (See also W75-

ltural runoff, *Iowa, Rivers, Dams,
ant identification, *Water pollution
, Biochemical oxygen demand, Nitrogen
nds, Phosphorus compounds, Chlorides,
ms, Sampling, Leaching, Water analysis,
data collections, On-site investigations,
ture.
ers: *Des Moines River(Ia).

s Moines River is the major waterway for a
art of central Iowa. One major dam has
onstructed on this river and a second is
onstruction. Saylorville Dam, expected to
pleted in 1975, is located a few miles north
Moines. This preimpoundment study of
ines River water quality is to be followed
st-impoundment study when the Saylorville
completed. During this study, beginning in July, 1967, samples of Des Moines River water have been collected from a number of sampling points. Data pertaining to a number of water quality parameters at one station were analyzed to determine whether any trends were apparent that would suggest the need to make additional analyses or studies before the reservoir is filled. These data were reported along with results of an investigation of the sources of pollutants. Sources related to farming and the agricultural industry were found to be major contributors to the pollution of the Des Moines River. It was concluded that the protection of the water quality of the Saylorville Reservoir will depend to a large extent in the future on the management practices that are employed by the agricultural community within the watershed area. **ACTMO, AN AGRICULTURAL CHEMICAL TRANSPORT MODEL,**
Agricultural Research Service, Chickasha, Okla.
M. H. Frere, C. A. Onstad, and H. N. Holtan.
USDA Report ARS-H-3, 54 p, June 1975. 18 fig, 17 tab, 57 ref.

Descriptors: *Mathematical models, *Water pollution sources, Sediment transport, Runoff, Model studies, Watersheds(Basins), Nutrients, Pesticides, Leaching, Erosion, *Chemicals, *Path of pollutants, *Agricultural watersheds.

A mathematical model has been developed to describe the movement of chemicals in and across an agricultural watershed. For each storm in a series of model predicts the mean concentration of the chemical in the runoff, the total amount carried by runoff water and sediment, and the location of the chemical remaining on the watershed. ACTMO is composed of three submodels. The hydrology submodel uses watershed characteristics to calculate runoff, infiltration, soil moisture, etc. from weather data. The erosional submodel uses soil characteristics to compute rill and interrill erosion, deposition, and clay enrichment from runoff predictions. The chemical submodel uses information about the chemical application along with data from the other two submodels to calculate the chemical movement. The watershed is limited to an area that can be described by a single rainfall input, such as a farm-size area. (ARS)

**AN EVALUATION OF PERSISTENCY FOR WATER BORNE ORGANICS,**
Worcester Polytechnic Inst., Mass.
F. L. Hart, T. Helfgott, and R. G. Bedard.
In: 30th Annual Purdue Industrial Waste Conference, May 6-8, 1975, West Lafayette, Indiana, Purdue University, 16 p. 1 fig, 2 tab, 11 ref. OWRT A-030-CONN(7). 14-31-0001-3007.

Descriptors: *Organic compounds, Aquatic environment, *Persistance, *Biodegradation, *Oxygen demand, *Nitrogen, *Industrial wastes, *Pesticides, Laboratory tests, Organic wastes, Pollutant identification, Path of pollutants, Water pollution sources.
Identifiers: *Refactory index, Degree of degredation, Water-borne organics, Ultimate oxygen demand.

A laboratory method is discussed for designating water borne organics, from both industrial wastewaters and natural sources, according to resistance to biodegradation. Procedures and deviations are given for the parameters 'Refactory Index' which is reported as a normalized number indicating degree of degradation. Real-time parameters of oxygen demand and nitrogen are used along with slower long-term biological/biochemical measurements to formulate the refractory index values. Lists of refractory index values for common industrial organics and natural materials are offered along with a discussion as to the significance of the refractory index and its interpretation. Measurements of organic carbon, nitrates, BOD(5), and ultimate BOD per 100mg of organic compounds are also reported. Organic materials, especially those originating from industry and characterized as refractory (i.e. having refractory index values close to zero) are considered persistent for stipulated environmental conditions. This persistency is extrapolated to the bioreactors of wastewater treatment and the receiving aquatic environment. (deLara-Connecticut)

## 5C. Effects Of Pollution

**UTILIZATION OF A KRAFT EFFLUENT CHANNEL BY FISH AND AQUATIC ORGANISMS,**
Florida Univ., Gainesville. School of Forest Resources and Conservation.
J. V. Shireman.
In: TAPPI Environmental Conference, Denver, Colorado, May 14-16, 1975, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 185-196. 7 fig, 14 ref, 3 tab.

Descriptors: *Pulp wastes, *Fish populations, *Benthic fauna, Dissolved oxygen, Sulfates, Turbidity, Hardness(Water), Chemical oxygen demand, Alkalinity, Aquatic life, Aquatic microorganisms, *Florida, Water pollution sources, Wastes, Industrial wastes, Water pollution effects, Fish types, Fish reproduction, Hydrogen ion concentration, Effluents.
Identifiers: Chronomids, Kraft mills.

Water quality parameters, fish populations, and benthic organisms were monitored from May 1974 to January 1975 in a kraft mill effluent channel of Hudson Pulp and Paper Corporation, Palatka, Florida. Dissolved oxygen in the channel ranged from 4.7 to 7.2 ppm and pH varied from 5.95 to 8.05 during the study. Sulfates and turbidity varied little and were less than 25 ppm. Total hardness, COD, and alkalinity were lowest during the summer and began to increase in September. Alkalinity and COD values continued to increase for the remainder of the study, but hardness increased

until October then dropped and leveled off from November through January. Benthic fauna consisted primarily of chronomids. The effluent channel was found to be suitable for fish habitation and growth. The most abundant species were mosquitofish, brown bullhead, white catfish, and warmouth. Bluegill, redear sunfish, golden shinner, yellow bullhead, and gizzard shad were less abundant but seemed to be permanent residents of the channel. The relative abundance of fish within the channel changed seasonally. There has been no indication of reproduction occurring in the channel, and thus recruitment must be from outside the channel. (Sykes-IPC)
W75-10377

**SWIMMING PERFORMANCE OF JUVENILE COHO SALMON (ONCORHYNCHUS KISUTCH) EXPOSED TO BLEACHED KRAFT PULP MILL EFFLUENT,**
B.C. Research Ltd., Vancouver. Div. of Applied Biology.
T. E. Howard.
Journal of the Fisheries Research Board of Canada, Vol 32, No 6, p 789-793, June, 1975. 13 ref. 5 tab.

Descriptors: *Salmon, *Swimming, *Performance, *Bleaching wastes, *Water pollution effects, *Pulp wastes, Wastes, Industrial wastes, Water pollution sources, Fish, Lethal limit, Aerobic treatment, Water pollution treatment, Color, Lignins, Toxicity, Pollutants, Water pollution.
Identifiers: Coho salmon(Oncorhynchus kisutch), Kraft mills.

Maximum critical swimming speeds were not achieved by fingerling coho salmon in concentrations of bleached kraft pulp mill effluent above a threshold concentration between 10-20% of the 96 hr LC(50). Reduction of swimming performance was related to effluent concentration but not to exposure time after the initial 18 hr. Swimming performance returned to control levels for fish tested in water after 6-12 hr recovery from exposure to effluent concentrations up to 0.7 LC(50). The effluent was rendered nontoxic by aerobic microbiological fermentation but some reduction in swimming performance was measured which was attributed, in part, to the effects of color and lignin materials remaining after treatment. These findings are discussed in relation to the mode of toxic action of bleached kraft mill effluents and their possible impact on aquatic ecosystems. (Witt-IPC)
W75-10387

**EFFECTS OF ACUTE EXPOSURE TO BLEACHED KRAFT PULP MILL EFFLUENT ON CARBOHYDRATE METABOLISM OF JUVENILE COHO SALMON (ONCORHYNCHUS KISUTCH) DURING REST AND EXERCISE,**
B. C. Research Ltd., Vancouver. Div. of Applied Biology.
D. J. McLeay, and D. A. Brown.
Journal of the Fisheries Research Board of Canada, Vol 32, No 6, p 753-760, June, 1975. 2 fig, 42 ref.

Descriptors: *Salmon, *Carbohydrates, *Metabolism, *Water pollution effects, Wastes, Industrial wastes, Water pollution sources, Fish, Lethal limit, Toxins, Aquatic animals, Water pollution, Swimming, Biochemistry.
Identifiers: Coho salmon, Liver, Glycogen, Plasma, Glucose, Muscle, Blood sugar.

In the static study (no exercise), liver glycogen stores were unchanged during 12 hr exposure to 0.8 of the 96 hr LC(50); longer exposures caused a progressive decrease to levels one-fifth those of controls at 72 hr. Plasma glucose levels in fish held in 0.8 LC(50) effluent for 3-96 hr were elevated; at 96 hr, glucose had increased three-fold. Mean values for plasma lactate were elevated at 3, 6, 24, 72, and 96 hr. In the exercise (swimming one body length/second)-rest study, muscle glycogen levels decreased 53-78% during exercise in water or effluent (0.7 LC(50) for 4-12 hr, and did not recover during 12 hr rest in water. Muscle glycogen for fish exercised for 12 hr in effluent and then rested for 4-12 hr in effluent was lower compared to values for fish exercised in effluent and then rested in water. There was no difference in liver glycogen levels of fish exercised in effluent or water for 4-12 hr. Values of liver glycogen for fish exercised in effluent for 12 hr and then rested for 4, 8, or 12 hr in effluent decreased 60-70% compared to fish exercised in water for 12 hr and then rested in water and by 55-65% from fish exercised in effluent for 12 hr and rested in water for 4-12 hr. Plasma glucose levels were elevated one- to four-fold during exercise in water or effluent. Fish resting in water for 4, 8, or 12 hr following exercise in water had relatively stable glucose levels; whereas for fish exercised and then rested in effluent the glucose levels increased two-fold during resting. Plasma lactate levels were elevated five- to six-fold during exercise in water or effluent for 4-12 hr, declining to values 1-2 times those of stock fish within 4 hr rest. Plasma lactate levels for fish exercised in effluent and then rested in effluent or water were higher than those for fish exercised and rested in water. (Witt-IPC)

**ENVIRONMENTAL LIMITATIONS ON THE MICROBIAL DEGRADATION OF HYDROCARBONS IN TEMPERATE LAKES,**
Wisconsin Univ., Madison. Dept. of Bacteriology.
D. M. Ward, and T. D. Brock.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 095, $5.25 in paper copy, $2.25 in microfiche. Wisconsin Water Resources Center, Madison, Technical Report, June 1975. 103 p, 16 fig, 5 tab. OWRT A-054-WIS(2). 14-31-0001-4050, 14-31-0001-5050.

Descriptors: *Microbial degradation, Organic compounds, *Biodegradation, Nutrients, *Nitrogen, *Oil pollution, *Phosphorus, *Wisconsin, Lakes, *Bacteria, Inhibition, Oxidation, Water pollution effects.
Identifiers: *Limiting nutrients, Heterotrophic bacteria.

Nutritionally versatile heterotrophic bacteria inhabit lakes and develop in response to hydrocarbon introduction. However, the response of naturally-occurring oil-degrading microorganisms depends on environmental conditions within a lake. The rate of hydrocarbon biodegradation varied seasonally in Lake Mendota because of temperature limitation in spring and fall and nutrient limitation in mid-summer, and was optimal for only one month during the year. Nutrient limitation was also observed in lakes of varying nutrient content in Vilas County. Relationships between hydrocarbon oxidation rates and temperature or nutrient levels were shown by correlation and experimentally, and optimum conditions established. Hexadecane oxidation was inhibited in lake wat and sediment samples incubated anaerobicall Acetate inhibition was indirectly caused by depl tion of nitrogen and phosphorus by acetate-oxid ing bacteria. Glucose inhibition occurred in t presence of excess nitrogen and phosphorus a may result from regulatory interference such catabolite repression. The presence of oil degra ing bacteria does not ensure rapid removal of pollutants in temperate lakes where environmen conditions usually limit hydrocarbon biodegrad tion.

**EFFECT OF A MIXTURE OF SUCCINIC AC MONO-SULPHO-ESTER AND OLEFIN SU FONATE ON FISH (UBER DIE WIRKU EINER MISCHUNG VON SULFOBERNSTE SAURE-HALBESTER UND OLEFINSULFON AUF FISCHE),**
Bundesforschungsanstalt fuer Fischerei, Hamb (West Germany). Institut fuer Kuesten- und B nen-fischerei
H. Mann, and H. Stache.
Archiv fur Fischerei Wissenschaft, Vol 25, 1/2, p 53-56; September 1974. 1 fig, 1 tab, 2 r (English abstract).

Descriptors: *Fish, *Rainbow trout, *Salmoni *Sulfur compounds, *Organic compoun *Toxicity, Lethal limit, Laboratory tests, F physiology, Water pollution effects, Biodegra tion.
Identifiers: *Golden ide, *Leuciscus i melanotus, *Succinic acid mono-sulpho-es *Olefin sulfonate, *Bioaccumulation.

The effect of a mixture of succinic acid mo sulpho-ester and olefin sulfonate on golden (Leuciscus idus melanotus) and rainbow tr (Salmo gairdneri) was examined. In the case golden ide the first losses occurred at 5 mg/l; v trout at 7.5 mg/l. These values were compared w the reduction in the surface tension of the responding concentrations. It was confirmed th detrimental effect on fish is to be noticed a reduction below 50 dyn/cm. The investiga product showed a good biodegradability. Acc ing to present investigations a detrimental ef on surface waters is not to be expected. (Katz)

**CITY OF PHOSPHAMIDON TO AMER- LOBSTERS (HOMARUS AMERICANUS) AT 4 AND 12C,**
es Research Board of Canada, St. Andrews Brunswick). Biological Station.
McLeese.
l of the Fisheries Research Board of a, Vol 31, No 9, p 1556-1558, September, fig, 2 tab, 9 ref.

Descriptors: *Lobsters, *Water temperature, *Pesticides, *Organophosphorus Pesticides, *Toxicity, *Lethal limit, Laboratory tests, Path of pollutants, Animal physiology, Water pollution effects.
Identifiers: LC50, LT50, *Phosphamidon, Bioaccumulation, *Fenitrothion, Running water, Static water.

The 96-h LC50 for phosphamidon for American lobsters, Homarus americanus, at 12C was 50 micrograms/liter and the lethal threshold is 18 micrograms/liter in both static and running water tests. At 4C the 96-h LC50 was 180 micrograms/liter and the lethal threshold was 18-28 micrograms/liter. Phosphamidon was 50-60 times less toxic than fenitrothion. (Katz)
W75-10413

**CORTICOSTEROID CONCENTRATIONS IN SOCKEYE SALMON (ONCORHYNCHUS NERKA) EXPOSED TO LOW CONCENTRATIONS OF COPPER,**
Fisheries and Marine Service, Vancouver (British Columbia). Vancouver Lab.
E. M. Donaldson, and H. M. Dye.
Journal of the Fisheries Research Board of Canada, Vol 32, No 4, p 533-539, April 1975; 2 fig, 9 tab, 14 ref.

Descriptors: *Salmonids, (Sockeye salmon, *Copper, *Copper compounds, *Bioassay, Fish Physiology, Water pollution effects, Laboratory tests, Lethal limit, Environmental effects, Pollutant identification.
Identifiers: Yearlings, *Steroids, *Corticosteroids, *Sublethal effects, Competitive protein binding, Technique, *Bioaccumulation, Stress response mechanism.

Yearling sockeye salmon (Oncorhynchus nerka) were exposed for 1-24 h to 10-7, 10-6, or 10-5 molar cupric sulphate in freshwater aquaria. Plasma cortisol, cortisone and 'total' corticosteroid concentrations were measured by a competitive protein binging technique. Cortisol, cortisone and 'total' corticosteroid levels were significantly higher than control concentrations after 1 h of exposure to 10-5 or 10-6m copper. 'Total' corticosteroid and cortisone concentrations were significantly higher than control concentrations after 2 and 4h of exposure to 10-7 m copper, respectively. Fish exposed to 10-5 copper died between 8 and 24 h. The data reflect a rapid corticosteroid stress response to lethal and sublethal concentrations of copper. The technique may be of use for rapid evaluation of effluents containing heavy metals, especially those containing a mixture of toxicants. (Katz)
W75-10415

**STUDIES ON THE METABOLISM OF CHLOROPHENOLS IN FISH-I ABSORPTION AND EXCRETION OF PCP BY GOLDFISH,**
Kyushv Univ., Fukuoka (Japan). Faculty of Agriculture.
K. Kobayashi, and H. Akitake.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 41, No 1, p 87-92, January 1975. 3 fig, 3 tab, 6 ref.

Descriptors: Freshwater fish, *Fish physiology, *Bioassay, *Absorption, *Organic compounds, *Lethal limit, Laboratory studies, Mortality, *Metabolism.
Identifiers: *Goldfish, Carassius auratus, Bioaccumulation, Excretion, *Pentachlorophenol(PCP), C-14 label, Adsorption rates.

At concentrations of pentachlorophenol (PCP) of 0.1, 0.2, and 0.4 ppm, the amount accumulated by goldfish, Carassius auratus increased with time. Maximum accumulation was observed in fish exposed to 0.2 ppm, giving 116 micro g-PCP/g-body weight. After 10 hr in PCP-free water only half of the original amount remained due to excretion by active elimination. PCP concentration in the fish increased by the amount expected from absorption minus that expected from excretion until 100 micro g-PCP-body weight concentration at which time mortality occured. PCP found in the fish had not undergone decomposition. (See also W75-10418) (Katz)
W75-10417

**STUDIES ON THE METABOLISM OF CHLOROPHENOLS IN FISH-II TURNOVER IN ABSORBED PCP IN GOLDFISH,**
Kyushu Univ., Fukuoka (Japan). Faculty of Agriculture.
K. Kobayashi, and H. Akitake.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 41, No 1, p 93-99, January 1975; 2 fig, 3 tab, 7 ref.

Descriptors: Freshwater fish, *Fish physiology, *Bioassay, *Adsorption, *Organic compounds, Tissue analysis, Membranes, Laboratory studies.
Identifiers: *Goldfish, Carassius auratus, Bioaccumulation, *Pentachlorophenol, *Gall bladder, Passive diffusion, Active elimination, Excretion.

Pentachlorophenol (PCP) absorbed by goldfish, Carassius auratus, was accumulated in various organs, especially the gall bladder. The biliary concentration of PCP reached 539 micro g/g after 24-hr exposure and showed further increase even after after fish were transferred to clean, running water for 24 hours, reaching a level of 1,077 micro g/g which accounted for 41% of the total PCP detected. A decrease in PCP level was observed for all other organs examined. The characteristic accumulation of PCP in the gall bladder indicates that fish can dispose of PCP by active elimination such as conjugation and decomposition, and passive diffusion. **UPTAKE OF THREE POLYCHLORINATED BIPHENYLS, DDT AND DDE BY THE GREEN SUNFISH, LEPOMIS CYANELLUS RAF.,**
Illinois State Natural History Survey, Urbana.
J. R. Sanborn, W. F. Childers, and R. L. Metcalf.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 2, p 209-217, February 1975. 6 fig, 4 tab, 16 ref.

Descriptors: *Polychlorinated biphenyls, *Aroclors, *Bioassay, *DDT, *DDE, *Metabolism, *Sunfishes, Freshwater fish, Laboratory tests, Analytical techniques, Tracers, Carbon radioisotopes, Pesticide residues, Pollutants, Absorption.
Identifiers: Lepomis cyanellus, Aroclor 1242, Aroclor 1248, Aroclor 1254.

The uptake of three pure 14C PCB's, DDT and DDE by the green sunfish was investigated in order to determine the physiologic effects of these compounds and their susceptibility to metabolism. The penta chlorobiphenyl showed a similar uptake and retention curve to DDT and DDE. The tetrachlorobiphenyl disappeared from test fish more rapidly than more highly chlorinated compounds and the trichlorobiphenyl was the most susceptible to metabolism. (Katz)

**ACUTE TOXICITY OF KANAMYCIN TO STEELHEAD TROUT (SALMO GAIRDNERI),**
Fisheries and Marine Service, Vancouver (British Columbia). Vancouver Lab.
J. McBride, G. Strasdine, and U. H. M. Fargerlund.
Journal of the Fisheries Research Board of Canada, Vol 32, No 4, p 554-558, April 1975; 6 fig, 1 tab, 9 ref.

Descriptors: *Rainbow trout, *Salmonids, Trout, *Toxicity, *Mortality, *Fish diseases, Fish physiology, Fish toxins, *Growth stages, *Antibiotics, Laboratory tests, Lethal limit, Bacteria, Pseudomonas.
Identifiers: *Steelhead trout, Tissue analysis, *Kanamycin, Aeromonas, Plasma cortisol pathology.

Kanamycin adminilstration at the recommended dosage (10.0-20.0 micro g) for the treatment of fish infected with species of Aeromonas and Pseudomonas was highly toxic to steelhead trout, Salmo gairdneri. Descriptions of both gross and microscopic pathological alterations, as well as plasms cortisol concentrations were provided. (Katz)
W75-10423

**EFFECTS OF METHYLMERCURY ON APPROACH AND AVOIDANCE BEHAVIOR OF MALLARD DUCKLINGS,**
Bureau of Sport Fisheries and Wildlife, Laurel Md. Patuxent Wildlife Research Center.
G. Heinz.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 5, p 554-564, May 1975; 5 tab, 16 ref.

Descriptors: *Mercury, *Waterfowl, *Environmental effects, *Animal behavior, *Mallard Duck, Birds, Ducks(Wild), Laboratory tests, Heavy metals, Methodology, Analytical techniques, Water pollution effects.
Identifiers: Methylmercury dicyandiamlde.

The effect of low dietary levels of methylmercury dicyandiamide fed to mallard ducks on approach and avoidance behavior of their offspring was investigated. The ducks were fed a control diet or a diet of 0.5 or 3 ppm mercury. The approach behavior, in response to a tape-recorded maternal call, and avoidance of a frightening stimulus were measured. There were no significant differences among ducklings in the percentage that approached the tape-recorded maternal call. Ducklings from parents fed the diet containing mercury were hypersensitive in the test of avoidance of a frightening stimulus. (Katz)

R. P. Sheridan, and M. A. Simms.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 5, p 565-569, May, 1975. 2 fig, 10 ref.

Descriptors: *Algae, *Insecticides, *Oxygen, *Respiration, *Photosynthesis, Laboratory tests, Primary productivity, Toxicity, Growth rate, Water pollution effects.
Identifiers: *Zectran.

Field samples of freshwater algae were examined to determine the effect of the insecticide Zectran on-photosynthesis rate. Concentrations of Zectran between 10 and 103 ppb affected neither oxygen production nor NaH14 CO3 uptake in any of the seven genera tested. However, Zectran at a concentration of 104 ppb after 1 hour effected a reduction in photosynthesis of Chroococcus, Oedogonium and in a mixed sample of Zygnema, Mougeotia and Spirogyra. Mougeotia, Spirogyra and Schizoonium were not affected by exposure to 104 ppb Zectran after an hour, but oxygen production was significantly reduced after 24 hours of exposure to this same concentration. **CRITICAL THERMAL MAXIMA OF THREE SPECIES OF HAWAIIAN ESTUARINE FISH: A COMPARATIVE STUDY,**
Oceanic Inst., Waimanalo, Hawaii.
J. R. Sylvester.
Journal of Fish Biology, Vol 7, No 2, p 257-262, 1975. 2 fig, 1 tab, 18 ref.

Descriptors: *Temperature, *Estuaries, *Fish, *Hawaii, Time, Thermal stress, Fish physiology, Seasonal, Laboratory tests, Brackish-water fish.
Identifiers: *Mugil cephalus, *Chelon engeli, *Kuhlia sandvicensis, Critical thermal maxima, Acclimation.

Critical thermal maxima of three species of Hawaiian estuarine fishes were determined in relation to acclimation temperature and time of day. The species studied were Mugil cephalus, Chelon engeli, and Kuhlia sandvicensis. Critical thermal maxima of all three species were significantly affected by acclimation temperature and time. In relation to acclimation temperature, M. cephalus and C. engeli have similar critical thermal maxima with K. sandvicensis having a critical thermal maxima about 1 degree C. lower than that of the two other species. Mugil cephalus and Chelon engeli showed an increasing critical thermal maxima toward midday which decreased thereafter. OCritical thermal maximum of Kuhlia sandvicensis increased throughout the day. **EFFECTS OF HEAVY METALS AND PESTICIDES ON THE MASS MORTALITIES OF CULTURED SHELLFISHES ALONG THE SOUTHWEST COAST OF TAIWAN, (IN CHINESE),**
Academia Sinica, Taipei (Taiwan). Inst. of Zoology.
S. S. Jeng, Y. W. Huang, J. L. Lain, L. T. Sun, and G. S. Wang.
Journal of the Fisheries Society of Taiwan, Vol 3, No 2, p 35-39, 1974. 3 fig, 15 ref. English abstract.

Descriptors: *Heavy metals, *Pesticides, *Chlorinated hydrocarbon pesticides, *Mortality, *Water pollution effects, *Oysters, *Bioassay, *Commercial Shellfish, DDT, Dieldrin, Mercury, Lead, Cadmium, Zinc, Nickel, Arsenic compounds, Population, Sampling, Environmental effects.
Identifiers: Tissue analysis, Bioaccumulation, BHC, *Taiwan.

Oysters reared along the southwest coast of Taiwan were sampled monthly for one year for heavy metals and organochlorine pesticides analyses. During their 'danger season', April, both dead and live oysters were analyzed. Results showed that heavy metal contents in the oyste were normal throughout the year and during t 'danger season', and were close to ordinary leve in the dead oysters. No aldrin, endrin, or he tachlor expoxide were detected and only sm amounts of DDT, BHC, and dieldrin were prese It was suggested that large-scale death of the she fish was not directly related to heavy metals a organochlorine pesticides. REASE OF NET CARBON FLUX IN TWO IES OF MUSSELS CAUSED BY EX- CTS OF CRUDE OIL,
achusetts Univ., Gloucester. Marine Station.
Gilfillan.
e Biology, Vol 29, No 1, p 53-57, 1975. 6 fig,

iptors: *Mussels, *Salinity, *Oil, *Carbon *Metabolism, *Stress, Water pollution ef- Laboratory tests, Toxicity, Water pollution es, Crustaceans.
fiers: Mytilus edulis, Modiolus demissus, oil, *Carbon flux.

ts of crude oil and salinity on the metabolism o common filter-feeding animals (Mytilus and Modiolus demissus) have been in- ated. Carbon budgets have been calculated ch species under a variety of combinations content and salinity. Both reduced salinity e presence of crude oil tend to decrease the rbon flux for each species; stresses from source interacted in their effects on experi- l animals. Although similar responses to oil shown by each species, Mytilus edulis ap- l to be slightly more resistant to oil than lus demissus. (Katz) 0433

C EFFECTS OF AN ANIONIC DETER- ON THE GILLS OF RAINBOW TROUT,
Univ., Birmingham (England). Dept. of ical Sciences.
Abel, and J. F. Skidmore.
Research, Vol 9, No 8, p 759-765, August 2 fig, 1 tab, 23 ref.

ptors: *Salmonids, *Rainbow trout, *Fish logy, *Organophosphorus compounds, r pollution effects, *Toxicity, *Detergents, atory tests, Lethal limit, Path of pollutants.
iers: Tissue analysis, Bioaccumulation, n lauryl sulphate, Gills, LT50, Sublethal Osmoregulation, Hypoxia.

anges that occurred in the gill tissue of rain- out, Salmo gairdneri, exposed to 100 mg/l n lauryl sulphate were similar to those in- by other toxic agents. The gill epithelium away from the underlying tissue, and ocytes and granulocytes invaded the sub- ial spaces. Detailed changes at the cellular mostly related to cell death, distinguished SLS-induced damage from that caused by zinc sulphate. Epithelial lifting was suggested to be a consequence of a decrease in gill surface area imposed by the need to maintain osmotic stability while sustaining the progressive loss of epithelial cells caused by pollutant action. (Katz)
W75-10434

**EFFECTS OF THE INSECTICIDE SEVIN AND ITS FIRST HYDROLYTIC PRODUCT, 1-NAPTHOL, ON SOME EARLY DEVELOPMENTAL STAGES OF THE BAY MUSSEL, MYTILUS EDULIS,**
Oregon State Univ., Newport. Dept. of Fisheries and Wildlife.
D. A. Armstrong, and R. E. Millemann.
Marine Biology, Vol 28, No 1, p 11-15, 1974. 1 fig, 2 tab, 16 ref.

Descriptors: *Bioassay, *Pesticides, *Growth stages, *Larval growth stage, Mussels, Toxicants, Bioindicators, Environmental effects, Water pollution effects.
Identifiers: *Mytilus edulis, Growth anomalies, Sublethal effects, EC50, *Sevin, 1-napthol.

Six developmental stages of the bay mussel Mytilus edulis from fertilization to 32 h after fertilization, and also unfertilized eggs, were exposed for 1 hr to different concentrations of the insecticide Sevin and its first hydrolytic product, 1-napthol. After exposure, the larvae or eggs were separated from the pesticide solution and returned to clean water. At 48 h after fertilization, the numbers of normal and abnormal larvae were determined and 1-h EC50 values (the effective concentrations that caused anomalous development of 50% of the test animals) were calculated. The most sensitive developmental stage was the one that occurred shortly after fertilization at the time of appearance of the first polar body. Thereafter, sensitivity decreased as age increased. The EC50 of Sevin for the first polar body stage and the 32-h stage were 5.3 and 24.0 mg/l of Sevin, respectively. The EC50 of 1-napthol for the first polar body stage was 5.2 mg/l. Effects of the toxicants on development were characterized by the disjunction of blastomeres, a reduction in the rate of development, and asynchronous and unaligned cleavages. (Katz)

**THE EFFECTS OF A NO. 2 FUEL OIL AND TWO CRUDE OILS ON THE GROWTH AND PHOTOSYNTHESIS OF MICROALGAE,**
Texas Univ., Port Aransas. Inst. of Marine Science.
W. M. Pulich, Jr., K. Winters, and C. Van Baalen.
Marine Biology, Vol 28, No 2, p 87-94, 1974. 3 fig, 5 tab, 10 ref.

Descriptors: *Oil, *Algae, *Growth rate, *Photosynthesis, *Sea water, *Toxicity, *Bioassay, Environmental effects, Analytical techniques, Toxicants, Diatoms, Dinoflagellates, Cyanophyta, Chlorophyta.
Identifiers: *Thalassiosira pseudonana, Crude oils, Microalgae, No 2 fuel oil.

Seawater, when equilibrated with a sample of No. 2 fuel oil, becomes toxic in varying degrees to growth of representative types of micro-algae, two blue-greens, a diatom, two greens and a dinoflagellate. For Thalassiosira pseudonana, a sensitive organism, if the toxic materials constitute 1-10% of the sample, 40-400 ppb is lethal. Growth and photosynthesis in other algae were affected at higher concentrations of oil-equilibrated seawater. Water solubles from Kuwait or Southern Louisiana crude oils were not toxic, however specific fractions obtained by distillation did show some water soluble toxicity. The growth of most organisms was inhibited by direct contact with these two crude oils. With both the seawater equilibrated with fuel oil and the crude oils, the toxic activity is mainly localized in medium and higher boiling fractions derived from distillation cuts from these materials. (Katz)

**THE BIOLOGICAL HALF-LIFE OF INORGANIC MERCURY IN THE DUNGENESS CRAB (CANCER MAGISTER),**
Fisheries and Marine Service, West Vancouver (British Columbia). Pacific Environment Inst.
J. P. Sloan, J. A. J. Thompson, and P. A. Larkin.
Journal of the Fisheries Research Board of Canada, Vol 31, No 10, p 1571-1576, October 1974. 2 fig, 5 tab, 9 ref.

Descriptors: *Crabs, *Mercury, *Computer programs, Equations, *Commercial shellfish, Laboratory studies, Animal physiology, Water pollution effects.
Identifiers: *Dungeness crab, Cancer magister, *Biological half life, Tissue analysis.

Experimental data indicated that inorganic mercury has a biological retention time of 20-25 days in the Dungeness crab (Cancer magister). Three theoretical models to explain the mode of elimination were tested by computer program. The validity of the widely used negative exponential 'biological half-life' is left in some doubt from the results obtained. (Katz)
W75-10437

**TOXICITY OF TWO SYNTHETIC PYRETHRINS TO BROWN TROUT,**
New York State Dept. of Environmental Conservation, Albany.
J. C. Skea, H. J. Dean, C. Talbot, and C. N. Frisa.
New York Fish and Game Journal, Vol 22, No 1, p 62-67, January 1975. 2 fig, 3 tab, 6 ref.

Descriptors: *Toxicity, *Insecticides, *Lethal limit, *Bioassay, *Brown trout, *Fingerlings, *Environmental effects, Salmonids, Laboratory studies, Dissolved oxygen, Organic pesticides, Water pollution effects.
Identifiers: *Pyrethrins, LD50 values, Survival rates.

The toxicity of two synthetic pyrethrins, SBP 1382 EC (24.3 per cent active ingredient) and Formula 7067 (5 percent active ingredient) was determined for fingerling brown trout. By bioassay, it was found that the 24-hour TLm for SBP 1382 EC was approximately 1.2 micrograms per liter and that the 24-hour and 48-hour TLm for Formula 7067 were 4.9 and 3.5 micrograms per liter, respectively. Data also indicated that there was a breakdown of SBP 1382 EC when mixed with acetone in stock solutions and kept for more than 24 hours. (Katz)
W75-10438

**TOXICITY OF PAIRED MIXTURES OF CANDIDATE FOREST INSECTICIDES TO RAINBOW TROUT,**
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
L. L. Marking, and W. L. Mauck.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 5, p 518-523, May 1975. 1 tab, 19 ref.

Descriptors: *Toxicity, *Organophosphorus compounds, *Insecticides, *Rainbow trout, *Bioassay, Pesticides, Fish, Laboratory tests, Phosphorous compounds, Lethal limit, Carbamate pesticides, Forestry, Water pollution effects.
Identifiers: *Synergistic effects, *Additive index, Forest insects.

Seven forest insecticides were tested individually and in paired mixtures against rainbow trout. The carbamate zectran was the least toxic, and the synthetic pyrethroids were the most toxic. Nine of the mixtures produced less than additive toxicity, nine produced additive toxicity and two produced greater than additive toxicity (synergism). None of

the mixture toxicities deviated markedly from additive, and only two pairs of mixtures would pose a greater toxicological hazard to fish than the individual chemicals. (Katz)

**RESPONSE OF FRESHWATER PROTOZOAN ARTIFICIAL COMMUNITIES TO METALS,**
Virginia Polytechnic Inst. and State Univ., Blacksburg.
J. A. Ruthven, and J. Cairns, Jr.
Journal of Protozoology, Vol 20, No 1, p 127-135, 1973, Illus.

Descriptors: *Protozoa, Metals, *Zinc, *Copper, Toxicity, Water pollution effects, Daphnia, Heavy metals.
Identifiers: Amoeba-proteus, Blepharisma, Chaos-carolinensis, Chilomonas-paramecium, Chlamydomonas-reinhardtii, Euglena-acus, Euglena-gracilis, Paramecium-caudatum, Paramecium-multimicronucleatum, Peranema-trichophorum, Stentor-coeruleus, Tetrahymena-pyriformis.

An artificial freshwater protozoan (Chilomonas paramecium, Tetrahymena pyriformis, Peranema trichophorum, Euglena gracilis, E. acus, Paramecium multimicronucleatum, P. caudatum, Blepharisma, Chlamydomonas reinhardi, Amoeba proteus, Stentor coeruleus, Chaos carolinensis) community was subjected to different concentrations of Zn and Cu in a test system consisting of Plexiglas troughs through which pond water flowed continuously. Although the percent survival of colonizing species exposed to Cu or Zn fluctuated greatly at each concentration, the range of toxicity for each compound allowed comparison of protozoa with other organisms with respect to resistance to heavy metal toxicity. Individual protozoan species also were exposed for 3 hr to Zn, Cu, Cr, phenol Pb, Mn, Co, HNO3, acetic acid, Al, Sn, and HCl to derive time to death curves. Protozoa tested appeared to be more resistant than Daphnia to phenol, K2Cr2O7, and Cu; however, some species were more sensitive than Daphnia, to Zn, nitric acid, and HCl. This suggests that the sensitivity of protozoa to toxicants may be either more or less than that of macroinvertebrates and that information does not suffice to predict sensitivity. Moreover, the relative sensitivity of protozoa to various toxicants will not always be the same, i.e., species X may be twice as tolerant to a toxicant as species Y, but its relative sensitivity may be quite different for another toxicant.--Copyright 1973, Biological Abstracts, Inc.

**EXPERIMENTAL INVESTIGATION ON THE BIOLOGICAL CONCENTRATION OF MERCURY-I. ON THE RATE OF MERCURY TRANSFER THROUGH THE FOOD CHAIN FROM JACK MACKEREL TO YOUNG YELLOWTAIL (IN JAPANESE),**
Aichi Prefecture Fisheries Experimental Station, Miya (Japan).
T. Suzuki, and M. Hatanaka.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 40, No 11, p 1173-1178, November 1974. 2 fig, 4 tab, 10 ref.

Descriptors: Fish, *Marine fish, *Food chains, *Food webs, *Mercury, *Path of pollutants, Metals, Seawater, Environmental effects, Growth rates, Life cycles, Water pollution effects.
Identifiers: Bioaccumulation, *Yellowtail, Trachrus japonicus, Seriola quinqueradiata, *Jack mackerel, *Methyl mercury, Tissue analysis.

After being reared in methylmercury dosed seawater, jack mackerels, Trachrus japonicus, were fed to tagged yellowtail, Seriola quinqueradiata, for 18 days maintaining normal feeding and growth rate. The total amount of mercury incorporated by the yellowtail was determined on the basis of body weight and amount of mercury of the jack mackerels. The rate of mercury transfer, 66% to 130% (average-88%) was calculated from the remaining mercury in the yellowtail and the total. The food chain was suggested to play a significant role in the biological concentration of mercury. (Katz)

**EFFECT OF WATER HARDNESS ON THE TOXICITY OF A NONIONIC DETERGENT TO FISH,**
Unilever Ltd., Sharnbrook (England). Unilever Research Lab.
P. W. A. Tovell, C. Newsome, and D. Howes.
Water Research, Vol 9, No 1, p 31-36, January 1975. 8 tab, 7 ref.

Descriptors: *Toxicity, *Detergents, *Hardness(Water), *Rainbow trout, *Bioassay, *Absorption, Laboratory tests, Methodology, Domestic wastes, Carbon radioisotopes, Water pollution effects.
Identifiers: *Carassius auratus, *Ethoxylate detergents.

Trout and goldfish were placed in treatment solutions of different water hardnesses containing ethoxylate (EO) detergents. Survival times were recorded. 14C-labelled EO was used to assess absorption. The toxicity of ethoxylates to fish acclimatized and treated in different water hardnesses, and the effect of cations on ethoxylate toxicity were also investigated. EO is slightly less toxic in hard water than in soft water. The hardness of the treatment solution has no marked influence on the amount of EO absorbed by the fish. Evidence suggests that there is little relationship between the composition of cations constituting a particular hardness and the toxicity of EO. Acclimatization in different water hardnesses does not affect the susceptibility of fish to nonionic ethoxylate detergents. (Katz)

**SOME OBSERVATIONS ON SPAWNING OF BROOK TROUT (SALVELINUS FONTINALIS MITCHILL) IN LIME NEUTRALIZED IRON HYDROXIDE SUSPENSIONS,**
Pittsburgh Univ., Pa. Graduate School of Public Health.
J. L. Sykora, E. J. Smith, M. Synak, and M. A. Shapiro.
Water Research, Vol 9, No 4, p 451-458, April 1975. 1 fig, 8 tab, 12 ref.

Descriptors: *Spawning, *Neutralization, *Iron oxides, *Lime, *Acid mine water, *Fish eggs, Hatchability, *Brook trout, *Iron, *Reproduction, Laboratory tests, Environmental effects, Water quality, Growth rates, Mortality, Temperature, Fish behavior, Metals, Alkalis(Bases), Acid-Base Equilibrium.
Identifiers: Salvelinus fontinalis, Sublethal effects, Suspended iron.

The long-term effect of lime neutralized suspended iron on brook trout spawning and egg hatchability was assessed in a flow-through environment with a modified proportional diluter. Results of a two-year study reveal low survival of maturing fish and a decline in egg production at higher suspended iron concentrations. Brook trout egg hatchability was unaffected in concentrations of lime neutralized iron hydroxide ranging from 0.75 to 12 mg Fe/l. A comparison of data on survival, growth, and egg hatchability indicates that the safe level of lime neutralized iron suspe for brook trout in an enclosed, intermitten testing system presumably lies between 7. 12.5 mg Fe/l. **SUPPRESSION OF NITROGEN FIXATION BY BLUE-GREEN ALAGE IN A EUTROPHIC LAKE WITH TRACE ADDITIONS OF COPPER,**
California Univ., Berkeley. Sanitary Engineering Research Lab.
A. J. Horne, and C. R. Goldman.
Science, Vol 183, No 4123, p 409-411, February, 1974. 1 fig, 1 tab, 19 ref.

Descriptors: *Pollution abatement, *Lakes, *Copper, *Chelation, *Eutrophication, Chemical reactions, Nitrogen, Plankton, Surface waters, *Cyanophyta, Water pollution effects, Water pollution control.

The specific effects of very low concentrations of added and indigenous copper on phytoplanktonic N2 fixation and photosynthesis in a lake where natural chelation should be high were reported. Nitrogen fixation by blue-green algae in highly eutrophic Clear Lake, California, was severely inhibited by trace amounts of copper. The chelation capacity of the lake was probably saturated by indigenous copper. Additions were only 1/200 of those normally used in algal control. Since nitrogen fixation provides half of the lake's annual nitrogen budget, economical eutrophication control appears possible. (Jernigan-Vanderbilt)

**WATER-SOIL-PLANT INTERACTIONS WITH TERBACIL,**
Hawaii Univ.-Hilo Coll., Hilo.
B. A. Kratky, and G. F. Warren.
Weed Science, Vol 21, No 5, p 451-454, 1973. Illus.

Descriptors: *Toxicity, Water pollution effects, *Sorghum, *Soil-water-plant relationships, Soils, Loam.
Identifiers: Phytotoxicity, Sorghum-bicolor, *Terbacil.

The phytotoxicity of terbacil (3-tert-butyl-5-chloro-6-methyluracil) is not closely correlated with the amount applied, the amount in available soil solution, or the concentration in available soil solution since soil type has a pronounced effect on the levels necessary for phototoxicity. About 19 times more terbacil was needed in a Chalmers silty clay loam (24% organic matter) than in a Bloomfield fine sand (o.3% organic matter) to cause a 30% control of sorghum (Sorghum bicolor (L.) Moench 'R.S. 610'). However, the Bloomfield fine sand required twice as great a concentration of terbacil in the soil solution as the chalmers silty clay loam (0.314 micro-g/ml versus 0.157 micro-g/ml). The total adsorption of terbacil in the latter soil decreased 4.5 fold when the water: soil ratio was increased from 0.6:1 (approximately field capacity) to 32:1, but the ratio of the concentration adsorbed: concentration in the soil solution did not vary appreciably.--Copyright 1974, Biological Abstracts, Inc.

**ARSENATE UPTAKE AND REDUCTION BY POCILLOPORA VERRUCOSA,**
Rhode Island Univ., Kingston. Graduate School of Oceanography.
M. E. Q. Pilson.
Limnology and Oceanography, Vol 19, No 2, p 339-341, March 1974. 1 fig, 8 ref. NSF (GA-34097).

Descriptors: *Coral, *Arsenic compounds, *Sea water, *Reduction(Chemical), Inorganic compounds, Chemical reactions, Phosphate, Cycles, *Absorption.

A scleractinian coral removed arsenate from solution and converted some of it to arsenite, which reappeared in the ambient seawater. This suggests that organisms other than bacteria may be responsible for maintaining some of the arsenic in seawater in a reduced form. Reduction of arsenate may be a mechanism to allow the loss from the living cell of arsenate transported in along with phosphate. (Jernigan-Vanderbilt)

**PRODUCTION OF MICROBIAL PROTEIN FROM WASTE CELLULOSE BY THERMOMONOSPORA FUSCA, A THERMOPHILIC ACTINOMYCETE,**
Wisconsin Univ., Madison. Dept. of Bacteriology.
D. L. Crawford, E. McCoy, J. M. Harkin, and P. Jones.
Biotechnology and Bioengineering, Vol 15, No 5, p 833-843, 1973, Illus.

Descriptors: *Thermophilic bacteria, *Actinomycetes, Microbiology, Production, *Protein, *Cellulose, Pulp wastes.
Identifiers: Thermomonospora-fusca.

The growth characteristics of T. fusca, a cellulolytic thermophilic actinomycete, are described in terms of growth on pulping fines, a cellulosic waste of the paper industry. A fermentation was

developed which substantially degrades this waste, with the residual product of growth containing about 30% microbial protein. This protein, as shown by a preliminary feeding study with baby chicks and by amino acid analyses, appears to be of good nutritional quality and contains no strongly toxic materials. The extracellular cellulolytic enzymes present in the spent broth are discussed in relation to their potential recovery as a by-product of the fermentation as a waste disposal system.--Copyright 1974, Biological Abstracts, Inc.

**WATER QUALITY CRITERIA FOR EUROPEAN FRESH-WATER FISH.**
Food and Agriculture Organization of the United Nations, Rome (Italy). European Inland Fisheries Advisory Commission.
Water Research, Vol 8, No 9, p 681, September 1974. 1 tab. EIFAC Technical Paper No. 20.

Descriptors: *Salmonids, *Chlorine, *Fish, *Invertebrates, Aquatic life, *Toxicity, *Water quality standards, Water pollution effects.
Identifiers: *Hypochlorous acid, *Chloramines, Bioaccumulation.

Toxicity of chlorine as hypochlorous acid and chloramines to aquatic life was studied. Coarse fish species, invertebrate organisms and plants were more resistant to chlorine than salmonids. Chlorine concentrations greater than 0.008 mg HOCl l(-1) were harmful or lethal within four days to both salmonids and coarse fish, whereas 0.004 mg HOCl l(-1) was endured by sensitive species of fish for five days. The effects of dissolved oxygen concentration, temperature, salinity, pH and water hardness on toxicity of chlorine were discussed. (Katz)

**WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH.**
Food and Agriculture Organization of the United Nations, Rome (Italy). European Inland Fisheries Advisory Commission.
Water Research, Vol 8, No 9, p 683-684, September 1974. 1 tab. EIFAC Technical Paper No. 21.

Descriptors: *Freshwater fish, Salmonids, Atlantic salmon, Rainbow trout, Brown trout, Carp, *Fish behavior, *Zinc, *Metals, *Toxicity, *Water qualitystandards, Water pollution effects, Fish behavior, Environmental effects.
Identifiers: Gold fish, Bioaccumulation, Avoidance behavior.

The toxicity of solutions containing zinc was attributable to the zinc ion and possibly to particulate zinc present as the basic carbonate or the hydroxide held in suspension. It was modified by water quality, particularly by an increase in hardness, temperature, salinity, suspended solids and dissolved oxygen. The acute toxicity of zinc in the presence of other heavy metals and common pollutants seemed to be additive. The effect of zinc was reduced by acclimation and age of fish. Atlantic salmon, rainbow trout, carp, goldfish, brown trout in both field and laboratory studies demonstrated avoidance behavior patterns to certain zinc concentrations. For the maintenance of thriving populations of fish the annual 95 percentile of concentrations of zinc should be no greater than 0.1 of the appropriate 7-d LC50 at 15C. The criteria would depend on the water hardness and type of fish. (Katz)

Mississippi State Univ., Mississippi State. Dept. of Biochemistry.
D. Desaiah, and R. B. Koch.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 2, p 153-158, February 1975. 1 fig, 3 tab, 19 ref.

Descriptors: Freshwater fish, *Catfish, *Fish, Physiology, Biochemistry, *Enzymes, Organic compounds, *Bioassay, Laboratory tests, Design, Methodology, Inhibition, Water pollution effects.
Identifiers: *Channel catfish, Ictalurus punctatus, *ATPases, *Kepone(Trade Name), DCPD, Tissue analysis, Brain.

The effects of Kepone(Trade Name) and its reduction product DCPD (decachloropentacyclo-decan-5-ol) on channel catfish, Ictalurus punctatus, brain ATPases in vitro were studied. The inhibition of Na+-K+ ATPase by Kepone(Trade Name) and DCPD was similar. Inhibition increased with increased concentration of the inhibitors. Oligomycin-sensitive (mitochondrial) Mg+2 ATPase from catfish brain showed greatest sensitivity to the inhibitors. Oligomycin-insensitive Mg+2 ATPase activity showed similar sensitivity to the inhibitors but inhibition was less than for mitochondrial Mg+2 ATPase. (Katz)

**COPPER, ZINC AND TOTAL PROTEIN LEVELS IN THE PLASMA OF SOCKEYE SALMON (ONCORHYNCHUS NERKA) DURING THEIR SPAWNING MIGRATION,**
Memorial Univ. of Newfoundland, St. Johns. Marine Sciences Research Lab.
G. L. Fletcher, E. G. Watts, and M. J. King.
Journal of the Fisheries Research Board of Canada, Vol 32, No 1, p 78-82, January 1975. 2 fig, 1 tab, 19 ref.

Descriptors: Salmonids, *Sockeye salmon, Heavy metals, *Proteins, Fish physiology, Bioassay, Growth stages, *Metabolism, *Spawning, Fish reproduction, *Fish Migration, Laboratory tests, Water pollution effects, Canada, *Zinc, *Copper.
Identifiers: Tissue analysis, Bioaccumulation, Plasma, Plasma proteins.

Concentrations of copper, zinc and total protein were measured in the plasma of sockeye salmon (Oncorhynchus nerka) during their migration to the Chilko spawning grounds, British Columbia. Concentrations of both metals and total protein declined during migration. Final values for all three parameters were 20-50% of those observed in seawater animals. Concentrations of zinc and copper were positively correlated with plasma protein concentrations. An examination of the metal: protein ratios revealed that only the zinc: protein ratios declined during migration, suggesting that zinc was being removed from the plasma independent of the proteins. **EFFECTS OF TEMPERATURE ON DEVELOPMENT AND SURVIVAL OF RAINBOW TROUT, SALMO GAIRDNERI, IN ACID WATERS,**
Ontario Ministry of Natural Resources, Sault Ste. Marie (Ontario). Fish and Wildlife Research Branch.
W-H. Kwain.
Journal of the Fisheries Research Board of Canada, Vol 32, No 4, p 493-497, April 1975. 3 fig, 15 ref.

Descriptors: *Salmonids, *Rainbow trout, *Growth stages, *Embryonic growth stage, Fish eggs, *Mortality, *Toxicity, Hydrogen ion concentration, *Water temperature, Water quality, Water pollution effects, Laboratory tests, Lethal limit, Fish physiology, Acidic water.
Identifiers: Fingerlings, LC50, Survival rates, Bioaccumulation.

Differences in mortality of rainbow trout, Salmo gairdneri, embryos were significant ($P < 0.05$) when the eggs were exposed to 5,10, and 15C and pH levels from 3.0 to 6.0. Below pH values of 4.49 no embryos survived, regardless of temperature. The medium lethal pH values for rainbow embryos were 4.75 and 5.52 at temperatures of 10 and 5C, respectively. Differences in lethal pH values for fingerlings were significant ($P < 0.05$) when exposed to water temperatures of 5,10,15 and 20C and acclimation temperatures of 10 and 20C. The median lethal pH values of fingerlings were positively related to the test water temperatures and ranged from 3.86 to 4.49. Resistance of yearling trout to acid waters was higher than of fingerlings. (Katz)
W75-10623

**THE EFFECT OF SUBLETHAL CONCENTRATIONS OF COPPER AND ZINC ON VENTILATORY ACTIVITY, BLOOD OXYGEN, AND PH IN RAINBOW TROUT (SALMO GAIRDNERI),**
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
C. M. Sellers, Jr, A. C. Heath, and M. L. Bass.
Water Research, Vol 9, No 4, p 401-408, April 1975. 7 fig, 39 ref.

Descriptors: *Salmonids, *Rainbow trout, *Heavy metals, *Zinc, *Copper, *Fish physiology, *Respiration, *Bioassay, Ventilation, Hydrogen ion concentration, Oxygen requirements, Laboratory tests, Toxicity, Environmental effects, Water pollution effects, *Lethal limit.
Identifiers: Blood oxygen, Sublethal concentrations, Gills, Catherization, Coughing, Pressure pulses.

Changes in buccal and opercular pressure amplitude, as well as ventilation and coughing frequency were monitored in rainbow trout (Salmo gairdneri) using catheterization of respiratory cavities and pressure transducers. One or more of the ventilatory parameters measured were found to change under toxicant stress at concentrations of copper or zinc at or below the LC50. Possible synergistic effects were indicated when the two metal ions were tested together. Serial analyses of arterial P02 and pH in fish exposed to copper and zinc individually at concentrations approximating the LC50 showed that environmental zinc produced a sharp decrease in both P02 and pH. Copper, however, caused little effect other than a transient increase in pH. The toxic action of the two metals in low concentrations thus may not be the same. (Katz)

**ABSORPTION, METABOLISM, AND EXCRETION BY GOLDFISH OF THE ANIONIC DETERGENT SODIUM LAURYL SULPHATE,**
Unilever Ltd., Sharnbrook (England). Unilever Research Lab.
P. W. A. Tovell, D. Howes, and C. S. Newsome.
Toxicology, Vol 4, No 1, p 17-29, 1975. 9 fig, 1 tab, 25 ref.

Descriptors: *Sulfates, *Sodium sulfate, *Freshwater fish, *Fish physiology, *Bioassay, *Metabolism, *Path of pollutants, *Detergents, *Absorption, Laboratory tests, Water pollution effects.
Identifiers: *Goldfish, Carassius auratus, Tissue analysis, Excretion, Bioaccumulation, Sodium lauryl sulphate, Anionic detergent, SLS, Gall bladder.

The route of absorption, tissue distribution, metabolism, route of excretion, and excretion rate of the anionic detergent sodium lauryl sulphate (SLS) in goldfish (Carassius auratus) was investigated using (35S) or (1-14C) SLS. Goldfish absorb SLS from solution principally through the gills. SLS is rapidly distributed throughout the body tissues, the highest concentration being found in the gall bladder. SLS was metabolized by the fish to butyric acid-4-sulphate, and was excreted by the kidney. Over a 24-h period 68% and 38% of a prescribed dose was excreted from freely fed and unfed fish, respectively. (Katz)

**INFLUENCE OF A THERMAL EFFLUENT ON MOVEMENT OF BROWN BULLHEAD (ICTALURUS NEBULOSUS) AS DETERMINED BY ULTRASONIC TRACKING,**
Canada Centre for Inland Waters, Burlington (Ontario).
J. R. M. Kelso.
Journal of the Fisheries Research Board of Canada, Vol 31, No 9, p 1507-1512, September 1974. 5 fig, 2 tab, 7 ref.

Descriptors: *Bullheads, *Ultrasonics, *Marking techniques, *Thermal pollution, Effluents, *Fish physiology, Temperature, Nuclear powerplants, Water pollution effects, *Pollutant identification.
Identifiers: *Brown bullhead, Swimming characteristics, Movement patterns, Lake Ontario, Thermal plume.

Ten Brown bullhead (Ictalurus nebulosus) were captured within the influence of a thermal discharge in Lake Ontario, marked with ultrasonic transmitters and continuously tracked for 29-344 minutes. Five control bullheads were similarly monitored at a control site. Fish caught and released in the discharge area remained within 50-700m of the release point, turned frequently and sharply, and swam at an average speed of 30 cm/s. Control fish moved along shore, average speed 48 cm/s, in straighter paths up to 4200 m from the release point. On the morning following release, only 20% of the fish released in the discharge were still there, indicating that association with the plume was of short duration. The study indicates that the thermal discharge can interrupt or alter normal movement patterns of brown bullhead. (Katz)

**UPTAKE, ELIMINATION AND BIOTRANSFORMATION OF THE LAMPRICIDE 3-TRIFLUROMETHYL-4-NITROPHENOL (TFM) BY LARVAE OF THE AQUATIC MIDGE CHIRONOMUS TENTANS,**
Viterbo Coll., La Crosse, Wis. Dept. of Biology.
J. A. Kawatski, and M. A. Bittner.
Toxicology, Vol 4, No 2, p 183-194, May 1975. 3 fig, 5 tab, 9 ref.

Descriptors: *Aquatic insects, *Midges, *Toxicity, *Organic compounds, Hardness(Water), *Bioassay, Water quality, Laboratory tests, Water pollution effects.
Identifiers: Chironomus tentans, *Lampricides, *TFM, 3-Trifluoromethyl-4-nitrophenol, *Sublethal concentrations, Tissue analysis, Bioaccumulation, Biotransformation.

Accumulation of (14C) 3-trifluoromethyl-4-nitrophenol ((14C) TFM) by aquatic midge, Chironomus tentans, larvae from sublethal aqueous concentrations was rapid and dependent upon hardness of water. TFM was readily biotranformed to at least two polar derivatives, including sulfated TFM and TFM-glucuronide. Some TFM was also reduced to the phenol/amine. Chironomus tentans quickly eliminated all TFM derivatives as well as the parent (14C) TFM. (Katz)

**PHYSIOLOGICAL CHANGES IN THE SERUM AND HEPATOPANCREAS OF YELLOW TAIL INJECTED WITH CARBON TETRACHLORIDE, (IN JAPANESE),**
Hyogo Prefecture Fisheries Experiment Station, Akashi (Japan).
H. Sakaguchi, and A. Hamaguchi.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 41, No 3, p 283-290, March 1975; 2 fig, 6 tab, 14 ref.

Descriptors: Fish, Organic compounds, *Fish physiology, *Enzymes, *Bioassay, Laboratory tests, Water pollution effects.
Identifiers: *Carbon tetrachloride, *Yellow tail, Tissue analysis, Bioaccumulation, *Serum, *Hepatopancreas.

Yellow tail were injected with carbon tetrachloride at dosages of 0.05-0.2 ml/100 g body weight. Separation of cell cords, congestion of sinusoid and a decrease in the number and size of lipids in the hepatopancreas were observed. Activities of lactic dehydrogenase (LDH), glutamic oxaloacetic transaminase (GOT) and glutamic pyruvic transaminase (GPT) in serum increased. Serum triglyceride, total cholesterol, beta-lipoprotein and protein decreased after 2 to 6 hours, but recovered to control levels after 24 hours. (Katz)

**EFFECTS OF CHLORINATED HYDROCARBON POLLUTANTS ON GROWTH OF MARINE PHYTOPLANKTON IN CULTURE,**
State Univ. of New York, Stony Brook.
N. S. Fisher.
Available from University Microfilms, Inc., Ann Arbor, Michigan, 48106. Order No 74-27,824. PhD Thesis, 1974, 195 p.

Descriptors: *Toxicity, *Water pollutant effects, *Algae, *Chlorinated hydrocarbon pesticides, *DDT, Polychlorinated biphenyls, Cultures, *Phytoplankton, Organic compounds, Plant growth, Marine algae.

An evaluation was made of the applicability of batch and continuous culture toxicity tests to natural ecosystems. Six species of marine planktonic algae were subjected to polychlorinated biphenyls and DDT in various concentrations. The effect of these compounds on their growth was studied. Both artificial communities and natural communities of the algae were observed. Due to an impermanence of conditions in aquatic environments and the relatively low phytoplankton cell densities normally occurring, most phytoplankton species will adopt a density-dependent strategy, involving such mechanisms as allelochemics. By interfering with competitive abilities of some phytoplankton, chlorinated hydrocarbons disrupt successional patterns and alter species composition in algal communities in nature. Animal communities would be indirectly affected as many herbivores graze selectively. (Prague-FIRL)
W75-10636

**THE EFFECT OF CERTAIN ORGANIC POLLUTANTS ON COPPER TOXICITY TO FISH (LEBISTES RETICULATUS),**
Michigan Univ., Ann Arbor.
J. A. Black.
Available from University Microfilms, Inc., Ann Arbor, Michigan, 48106. Order No 74-25,152. PhD Thesis, 1974, 140 p.

Descriptors: *Water pollutant effects, *Organic wastes, *Toxicity, *Copper, Fish toxins, Bioassay, Sewage, Metals, Pollutant identification.
Identifiers: *Anodic stripping voltammetry, Organic pollutants.

Anodic stripping voltammetry (ASV) was used to measure the degree of copper-organic binding in bioassay solutions. The relative toxicities of several copper-organic complexes to fish and the relationship of these toxicities of the relative bin ing abilities of the organic ligands for copper we studied. Guppies were exposed to copper-orgar complexes during 96 hour bioassays conducted soft water at pH 7.5. Fish were analyzed by aton absorption spectrophotometry to determine t amount of copper accumulation in internal orga The organic compounds tested were chosen on t basis of their prevalence as pollutants. Glycir cysteine, EDTA, NTA, and citric acid were test in the concentration range of 1 to 3 times ten to t minus sixth power M. Albumin, humic acid, a secondary sewage effluents had concentrations 5.0 mg/liter. The organic compounds found reduce copper toxicity to fish included NT glycine, EDTA, and humic acid. Those with no fect on toxicity were albumin, sewage effluc cysteine, and citric acid. Organically bound cop is less toxic than unbound copper. The methodo gy of ASV is discussed as a possible technique predict metal toxicity in natural waters. (Prag FIRL)

**800 MILES TO GO,**
Alyeska Pipeline Service Co., Bellevue, Wash.
R. H. Merrett.
NLGI Spokesman, Vol 38, No 12, p 421-4 March, 1975. 14 fig.

Descriptors: *Pipelines, *Alaska, *Environmer effects, Water quality control, Oil wastes, Mo toring, Costs, Personnel, Oil pollution.
Identifiers: *Alaska pipeline.

The Alaska pipeline and its environmental effe are discussed. Both Federal and State agen have been assigned to monitor pipeline work two lane 360-mile road is being built along route of the pipeline as well as shorter auxill roads. The project is the largest privately fun construction effort ever undertaken, amountin $4.5 billion. The extreme terrain and temperatu along its 800 miles present unique problems in gineering and design. Water and air quality con facilities are described. All ballast water from kers which take on oil will be processed and rified before being returned to the harbor. W will be discharged with less than 8 ppm of Problems of long-term management such as monitoring, personnel management, and scheduling of inspections are detailed. (Pra FIRL)

**THE EFFECT OF CRUDE OIL FRACTIONS THE SURVIVAL OF A TIDEPOOL COPEI TIGRIOPUS CALIFORNICUS,**
California State Univ., Northridge. Dept. of B gy.
C. J. Barnett, and J. E. Kontogiannis.
Environmental Pollution, Vol 8, No 1, p 4 January, 1975. 6 fig, 7 ref.

Descriptors: *Oil pollution, Oceans, *Cope Crustaceans, Invertebrates, Laboratory stu *Water pollution effects, Marine ani Gasoline, *Toxicity, *Oil wastes, Indu wastes, Organic compounds.
Identifiers: *Tigriopus californicus, Diese Kerosene, Benzene.

Oil pollution of oceans is a current ecol problem. The effects of petroleum produc various marine species are not well docum

e now under both field and laboratory in-
ation. In this case, the effects of four com-
crude oil fractions on the surface of a
ol copepod were studied in the laboratory.
igriopus californicus, four concentrations
f diesel oil, kerosene, gasoline, and benzene
ested. Diesel oil was the most detrimental; in
ntrations of 0.10 ml/liter, mortality resulted
five days. Gasoline showed the highest
ity within the first 24 hours while benzene
ost lethal between the first and second days.
rder of toxicity from greatest to least was
oil, kerosene, gasoline, benzene. The more
evaporating crude oil fractions present the
t hazards. The survival of this species is in-
proportional to the concentration of the
oil fraction in the environment. (Prague-

Engineering structures, Pipelines, Con-
n, Water pollution effects, Texas.

mental aspects of a deepwater crude oil
ng terminal have been studied at two sta-
f the coast of Texas. The first study was
ted for the Council on Environmental
and the second for SEADOCK, Incor-
, both by Texas A and M University.
CK is a corporation formed to operate a
ter facility to handle very large crude car-
the 100,000 to 700,000 deadweight ton
he construction schedule and its impacts
ines. Field sampling has been conducted to
baseline information on the physical,
l, and biological characteristics of the
d to estimate the impact of the project on
arine environment. Fuel pipelines,
es, pumps, and mooring systems are
d. The existence of platform structures,
oys and such pipelines should have little
impact on the marine environment and
vide an artificial reef for colonization by
narine organisms. Oil spill hazards were
by models developed which provided in-
n on response time available for control,
of the coast requiring protection, and con-
ns of soluble oil fractions in the water
The location of an offshore terminal com-
s concluded to be the most sound choice
nentally, as any major spills would be less
s in an esturial inshore area. Transit time
re entrances should provide enough time
ctive action in the event of any oil spill.

rs: *Chlorination, *Sewage treatment,
, *Fishkill, Chemical reactions,
*Michigan, Minnows, Rainbow trout,
nit, *Municipal wastes, Water pollution
ata collection.

Chlorinated municipal waste discharges were lethal to rainbow trout held downstream from three of four Michigan plants studied. The major factor affecting chlorinated waste toxicity was toxicity was dilution by river flow. At the Charlotte treatment plant the mean total residual chlorine concentration (TRC) of the effluent during exposure was 1.77 mg/l. Almost 100% kill of trout was observed 3200 ft downstream during exposure. The toxicity ceased between 3200-10,500 ft downstream, with extremely low TRC found toxic (an average of 0.007 mg/l). The West Branch treatment plant TRC exposure was 1.35 mg/l. This waste was toxic to 50% of the fish 500 ft downstream. The trout survived a mean TRC of 0.002 mg/l at another station. The Mason treatment plant TRC concentration was 2.64 mg/l. Toxicity was evident at least 4600 ft downstream. Extremely low concentration (0.046 mg/l) were toxic to the trout but they survived 0.013 mg/l at another station. The mean TRC during the chlorinated exposure at the Roscommon plant was 18.92 mg/l. No fish mortality was evident, apparently due to the high dilution of the waste in the river. It is recommended that in-plant monitoring of chlorine be performed with a more accurate means than the orthotolidine color comparator. (Auen-Wisconsin)

**FISHES OF THE HIWASSEE RIVER SYSTEM: ECOLOGICAL AND TAXONOMIC CONSIDERATIONS,**
Wapora, Inc., Washington, D.C.
R. K. Hitch, and D. A. Etnier.
J Tenn Acad Sci, Vol 49, No 3, p 81-87, 1974, Illus.

Descriptors: *Tennessee, *Fish, *Systematics, Ecology, Rivers, *Ecological distribution, Mine wastes, Tributaries, Water pollution effects.
Identifiers: Etheostoma camurum, *Hiwassee River(Tenn), Hypentelium-etowanum, Ichthyozon-hubbsi, Micropterus-coosae, Notropis-spectrunculus, Perca-flavescens, Percina-aurantiaca, Percina-burtoni, Percina-squa-ata, Phoxinus, *Fish diversity.

Collections of fishes (72) were made in the Hiwassee River Tennessee, and its tributaries between Aug. 1970-July, 1971. Greatest emphasis was placed on studies of the ecological relationships, distribution, and taxonomy of smaller species. Seventy-two species of fishes are known to occur in the Hiwassee system, with species of special significance including Ichthyomyzon hubbsi, Notropis spectrunculus, and undescribed dace of the genus Phoxinus, Hypentelium etowanum, Micropterus coosae, Perca flavescens, Etheostoma camurum, Percina aurantiaca, P. burtoni and P. squamata. Mining wastes were found to have greatly reduced the diversity of fishes in the Ocoee River and some of its tributaries.--Copyright 1974, Biological Abstracts, Inc.

**TOXICITY OF THE LAMPRICIDE 3-TRIFLUOROMETHYL-4-NITROPHENOL (TFM) TO 10 SPECIES OF ALGAE,**
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
A. W. Maki, L. D. Geissel, and H. E. Johnson.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. In: Investigations in Fish Control, United States Department of the Interior, Fish and Wildlife Service, Washington, D.C. 1975, No 56. 17 p, 3 fig, 5 tab, 12 ref.

Descriptors: *Pesticides, *Algae, *Growth rates, *Toxicity, Laboratory tests, Environmental effects, Chlorophyta, Toxicants, Diatoms, Cyanophyta, Inhibition, Inhibitors, Analytical techniques, Primary productivity, Mortality.
Identifiers: *Lampricides, *TFM, *Sublethal effects, Anabaena ssp., Chlorella ssp.

The toxicity of analytical and field grades of the lampricide-3-trifluoro-methyl-4-nitrophenol (TFM), to unialgal cultures of four green algae, four blue-green algae and two species of diatoms was examined in 96-hour toxicity tests. A 50% inhibitation of growth occurred in concentrations less than 10 mg/liter of TFM for all species tested except Chlorella pyrenoidosa, which was resistance at concentrations greater than 15 mg/liter. Inhibition of growth was lowest in the blue-green species, generally intermediate in the green algae, and severe in diatoms (50% effect levels, 1-4 mg/liter). Field grade TFM tended to be more toxic than the analytical grades. Growth tests indicated that exposure to TFM at concentrations of 30 mg/liter for 96 hours did not destroy the viability of algae cells but temporarily inhibited growth. (Katz)

**ACUTE TOXICITIES OF 3-TRIFLUOROMETHYL-4-NITROPHENOL (TFM) AND 2',5-DICHLORO-4'-NITROSALICYLANILIDE (BAYER 73) TO LARVAE OF THE MIDGE (CHIRONOMUS TENTANS),**
Viterbo Coll., LaCrosse, Wis. Dept. of Biology.
J. A. Kawatski, M. M. Ledvina, and C. R. Hansen, Jr.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402. In: Investigations in Fish Control, United States Department of the Interior, Fish and Wildlife Service, Washington, D.C., 1975, No 57, 5 p, 2 tab, 11 ref.

Descriptors: *Toxicity, *Pesticides, *Midges, *Hardness(Water), Laboratory tests, Food chains, Environmental effects, Water quality, Invertebrates, Aquatic insects, Toxicants, Mortality.
Identifiers: *TFM, Bayer 73, *Synergistic effects, EC50(Immobility), *Chironomus tentans, Molluscides, Lampricides, Sublethal effects.

TFM (3-trifluoromethyl-4-nitrophenol) and Bayer 73 (2',5-dichloro-4'-nitrosalicylanilide) were tested individually and together for toxicity to fourth instar Chironomus tentans in laboratory static tests at 22C. The 24-hr EC50 (immobility) values in soft water (total hardness, 40-48 mg/l as CaCo3) were 1.55 mg/l of 95.7% TFM, 0.570 mg/l of 70% Bayer 73, and 0.658 mg/l of total toxicant for a 98:2 mixture of TFM and Bayer 73. As water hardness increased, toxicity of the materials individually and in mixtures decreased. Synergistic toxicity was apparent only in soft water at exposures of 24-72 hr; generally, the toxic effect was additive. Considerably greater concentrations of toxicant were required to kill than to immobilize. (Katz)

**ACUTE TOXICITY OF THE LAMPRICIDE 3-TRIFLUOROMETHYL-4-NITRO-PHENOL (TFM) TO NYMPHS OF MAYFLIES (HEXAGENIA SP.),**
Winona State Coll., Minn.
C. R. Fremling.

For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402. In: Investigations in Fish Control, United States Department of the Interior, Fish and Wildlife Service, Washington D.C. 1975, No 58. 6 p, 1 fig, 16 ref.

Descriptors: *Toxicity, *Mayflies, *Pesticides, *Artifical substrates, *Hardness(Water), *Food chains, Temperature, Invertebrates, Environmental effects, Laboratory tests, Aquatic insects, Insects, Bioassay, Lethal limit, Hydrogen ion, Concentration, Toxicants.
Identifiers: *Lampricides, *TFM, *Hexagenia sp., LC50, Nymphs.

A recylcing test apparatus and burrow-containing artificial substrates were used to determine the toxicity of the lampricide TFM (3-trifluoromethyl-4-nitrophenol) against Hexagenia mayfly nymphs. Toxicity was relatively independent of temperature, but was greater in soft water than in hard water, and much greater at low than at high pH's; 12-hr LC50's were 4.0 at pH 6.5 and 270.0 at pH 9.5. (Katz)
W75-10699

**TOXICITY AND RESIDUE DYNAMICS OF THE LAMPRICIDE 3-TRIFLUORO-METHYL-4-NITROPHENOL (TFM) IN AQUATIC INVERTEBRATES,**
Bureau of Sport Fisheries and Wildlife, Columbia, Mo. Fish-Pesticide Research Lab.
H. O. Sanders, and D. F. Walsh.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402. In: Investigations in Fish Control, United States Department of the Interior, Fish and Wildlife Service, Washington, D.C. 1975, No 59. 7 p, 3 tab, 13 ref.

Descriptors: *Invertebrates, *Toxicity, *Pesticides, *Reproduction, *Mayflies, *Daphnia, *Crayfish, Pesticide residues, Environmental effects, Absorption, Aquatic insects, Lethal limit, Toxicants, Hardness(Water).
Identifiers: *TFM, *Lampricides, *Sublethal effects, Bioaccumulation, Scud, Damselfly, LC50.

Six species of aquatic invertebrates including scud, daphnid, crayfish, aquatic sowbug, damselfly nymph, and a mayfly nymph were exposed to TFM in toxicity tests in hard water at 21C. The 96-hr LC50 of field grade TFM (35.7%) was 57.0 mg/liter for scud and 110 mg/liter for crayfish; purified TFM (95.7%) was twice as toxic. The thirty-day LC50 of field grade TFM was 14 mg/liter for scud and 20 mg/liter for crayfish. LC50 values are based on whole formulation rather than active ingredient. Accumulation experiments employed 14C ring labelled TFM. All organisms accumulated TFM within 7 days. No reproductive impairment occurred in daphnids exposed to 2.4, 4.9 and 10 mg/liter field grade TFM for three generations. Reproduction stopped within the first generation when exposed to 18 mg/liter. (Katz)
W75-10700

**TOXICITY OF THE LAMPRICIDE 3-TRIFLUOROMETHYL-4-NITROPHENOL (TFM) TO THE NONTARGET FISH IN STATIC TESTS,**
Bureau of Sport Fisheries and Wildlife, LaCrosse, Wis. Fish Control Lab.
L. L. Marking, and L. E. Olson.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402. In: Investigations in Fish Control, United States Department of the Interior, Fish and Wildlife Service, Washington, D.C. 1975, No 60. 27 p, 23 tab, 10 ref.

Descriptors: *Pesticides, *Toxicity, *Bioassay, *Lethal limit, *Salmonids, Water quality, Hardness(Water), Hydrogen ion concentration, Warm-Water fish, Cold-water fish, Temperature, Laboratory tests, Fish, Perches, Bass, Carp, Salmon, Trout, Mortality, Testing, Water pollution effects, Pollutant identification.
Identifiers: *Lampricides, *TFM, *Static tests, LC50.

The toxicity of 3-trifluoromethyl-4-nitrophenol (TFM) to 15 species of coldwater and warmwater nontarget fish was tested in static tests. The toxicity of TFM is influenced by temperature, water hardness and pH, with pH being the most influential factor. In laboratory test water, TFM detoxifies slowly; solutions loss little or no activity over periods up to 8 weeks. The margin of safety (LC01 for fish/LC99 for lamprey) for rainbow trout in minimum lampricidal concentrations of TFM is influenced by pH and is greater in water of low pH (6.5) than in water of higher pH. Under laboratory conditions at pH 7.5 and 8.5, a 10% mortality of rainbow trout could be expected in lampricidal concentrations of field grade TFM. (Katz)
W75-10701

**TOXICITY OF THE LAMPRICIDE 3-TRIFLUOROMETHYL-4-NITROPHENOL (TFM) TO NONTARGET FISH IN FLOW-THROUGH TESTS,**
Bureau of Sport Fisheries and Wildlife, LaCrosse, Wis. Fish Control Lab.
L. L. Marking, T. D. Bills, and J. H. Chandler.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402. In: Investigations in Fish Control, United States Department of the Interior, Fish and Wildlife Service, Washington, D.C., 1975, No 61, 9 p, 4 tab, 13 ref.

Descriptors: *Laboratory tests, *Toxicity, *Salmon, *Trout, *Pesticides, Brown trout, Rainbow trout, Shiners, Brook trout, Lake trout, Perches, Water quality, Sunfishes, Channel catfish, Mortality, Lethal limits, Hydrogen ion concentration, Hardness(Water), Water pollution effects, Pollutant identification.
Identifiers: Flow-through tests, *Lampricides, *TFM, *Coho salmon, Oncorhynchus kisutch, Salvelinus ssp., LC50.

Field grade 3-trifluoromethyl-4-nitrophenol (TFM) was tested for acute and chronic toxicity to 11 species of nontarget fish in 4- and 30-day exposures, respectively. The species used were coho salmon, rainbow trout, brown trout, brook trout, lake trout, goldfish, catfish, blue-gill, red-ear sunfish, and yellow perch. The toxicity of the TFM formulation to two species of salmonids did not change significantly (P=0.05) between 1- and 30-day exposures. The results of simultaneous static and flow-through acute toxicity tests with channel catfish were not significantly different in two experiments. (Katz)
W75-10702

**TOXICITY OF THE LAMPRICIDE 3-TRIFLUOROMETHYL-4-NITROPHENOL (TFM) TO SELECTED AQUATIC INVERTEBRATES AND FROG LARVAE,**
Bureau of Sport Fisheries and Wildlife, Warm Springs, Ga. Southeastern Fish Control Lab.
J. H. Chandler, and L. L. Marking.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402. In: Investigations in Fish Control, United States Department of the Interior, Fish and Wildlife Service, Washington, D.C. 1975, No 62, 7 p, 2 tab, 14 ref.

Descriptors: *Toxicity, *Pesticides, *Invertebrates, *Bioassay, *Frogs, Aquatic animals, Larval growth stage, Annelids, Shrimp, Mollusks, Lethal limit, Laboratory tests, Water pollution effects, Pollutant identification.
Identifiers: *TFM, *Lampricides, *LC50, Static tests, Flow-through tests, Soft-bodied invertebrates.

The lampricide 3-trifluoromethyl-4-nitrophen (TFM) was tested against various groups of n target aquatic organisms. Flatworms, annel backswimmers, daphnids, seed and glass shrim bivalve mollusks, snails and mosquito larvae w among the invertebrates tested. Vertebrates posed to TFM were larvae of gray tree fr leopard frog and bullfrog. Larvae of tree fr were the most sensitive organism to TFM (96 LC50 = 1.98 mg/l) and backswimmers were least sensitive (96-hr LC50 = 555 mg/l). S bodied invertebrates were less sensitive snails and bivalve mollusks to TFM. The inv tebrates tested were less susceptible to TFM t larval lampreys in similar tests. (Katz)

: *Enteroviruses, Prague(Czech).

ses from Prague, Czechoslavia, sewage ere isolated on a strain of human diploid : lung cells (HDLC) and on secondary idney cell cultures (MKC). The sewage ere obtained from ten Prague nursery d two main sewers of the city. Thirty-six strains of each of the three types and 47 us strains were isolated. Twenty-four of irus strains had a cytopathic effect on cultures only, while 31 ECHO virus l a cytopathic effect on HDLC cultures, ers produced a cytopathic effect on both ells. The parallel titration of the ECHO ns isolated on HDLC and MKC deter- mined that most of the strains, on the type of cells on which the virus strains were found, produced a cytopathic effect. The possibility was considered that a greater resistance of HDLC to the non-viral toxicity of some sewage samples influenced the success of the isolation of enteroviruses. (Leibowitz-FIRL)

GROUNDWATER PROTECTION IN HIGHWAY CONSTRUCTION IN THE CATCHMENT AREA OF THE CITY OF BERNE AT KIESEN (GRUNDWASSERSCHUTZ BEIM AUTOBAHN IM FASSUNGSGEBIET STADT BERN IN KIESEN),
H. Geiser.
Gas Wasser Abwasser, Vol 54, No 9, p 385-392, September, 1974. 7 tab, 4 ref.

Descriptors: *Highway effects, *Groundwater, *Construction, Oil wastes, Bacteria, Municipal water, Water pollution effects, Water pollution sources.
Identifiers: Berne(Germany), Groundwater contamination.

The effect of turnpike construction on groundwater quality in the catchment area of the city of Berne at Kiesen, and measures taken to prevent groundwater contamination in the protected zone along the turnpike, are described. Highway construction operations, including those involving vibrations, caused a temporary impairment of the groundwater that had originally been of high quality, resulting in a general rise in both the germ count and in the appearance of Coliform bacteria. The water quality returned to normal after completion of the turnpike construction. As it was impossible to bypass the protected zone, groundwater contamination due to spilled gasoline, oil, and other chemicals will be prevented by a tight drain system for water from the turnpke into an oil separation tank, from which the cleaned water is discharged directly into a river. (Takacs-FIRL)
W75-10837

THE EFFECT OF PROLONGED EXPOSURE TO ELEVATED TEMPERATURES ON THE BIOCHEMICAL CONSTITUENTS, GONADAL DEVELOPMENT AND SHELL DEPOSITION OF THE AMERICAN OYSTER, CRASSOSTREA VIRGINICA,
Connecticut Univ., Noank. Marine Research Lab.
G. M. Ruddy, S. Y. Feng, and G. S. Campbell.

Descriptors: *Aquiculture, Shellfish farming, *Oysters, Powerplants, *Heated water, Biochemistry, Water pollution effects, *Thermal pollution.
Identifiers: *Gonadal development, Condition index, Shell deposition, Crassostrea virginica.

This study was designed to determine how oysters raised in the heated effluent of a power plant compare in quality, gonadal development and shell deposition with their controls maintained at ambient temperatures. The oysters in the heated effluent averaged 56% higher in protein concentration, 109% higher in carbohydrate concentration and 22% higher in condition index that the control oysters during the winter and spring months. The warm temperatures in the discharge canal during this period (14-19C) permitted the oysters to feed during the very large spring phytoplankton bloom, while the control oysters in the ambient temperature (2-7C) remained relatively inactive. During the summer months, the control oysters attained levels of protein, carbohydrate and condition index that were similar to those of the warm-water grown oysters. The development of the gonads of the oysters in the heated effluent occurred 4 months earlier than the controls, but spawning took place only 1 month earlier. The warm-water grown oysters produced thicker shells than the control oysters. (deLara-Connecticut)

Descriptors: *Water supply , Water quality, Water conservation, *Water reuse, *Recycling, Reclaimed water, Waste water(Pollution), Ion exchange, Membrane processes, Water treatment, Odor, Sewage, Sewage treatment, *Waste water treatment, Urine, Potable water, Satellites(Artificial), Biology, *Resins.
Identifiers: *Spacecraft, Perspiration, Feces, *Ion exchange resins.

The problem of water supply aboard a spacecraft is discussed together with probable solutions. The medical and technical characteristics of the design of water supply systems for spacecraft are considered, with emphasis on water quality and conservation of drinking water. Various methods of regenerating water from moisture-containing products (feces, urine, and perspiration) of human vital activity and recycling of water used for sanitary and hygienic purposes are examined. Considerable attention is devoted to the regeneration of water by ion-exchange resins and absorbent materials, as well as semipermeable membranes. The problems involved in decontaminating and deodorizing recycled water are examined in detail. (Witt-IPC)

**STUDY OF SOLID WASTE MANAGEMENT PRACTICES IN THE PULP AND PAPER INDUSTRY.**
Gorham International, Inc., Maine.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-234 944, $7.00 in paper copy, $2.25 in microfiche. February 1974. 196 p, 17 fig, 20 ref, 11 tab.

Descriptors: *Pulp and paper industry, *Solid wastes, *Management, Water pollution sources, Waste disposal, Wood wastes, *Waste water treatment, Sludge, Economics, *Waste treatment, Wastes, Industrial wastes, Pollutants, Water pollution control, *Pulp wastes.
Identifiers: Waste paper, Chemical pulping, Mechanical pulping, Papermaking, Kraft mills, Sulfite mills, Coated papers, Uncoated papers, Kraft linerboard, Corrugating medium, Kraft pulps, Neutral sulfite semichemical pulps, Deinking mills.

The structure of the pulp and paper industry is reviewed, including pulps used for papermaking, production processes (pulping, pulp bleaching, and papermaking), paper products, industry production, and considers solid waste generation points and characteristics, solid waste management practices, and estimates the quantities of solid wastes generated in wood processing, power generation, waste water treatment, waste paper reclamation, pulping (chemical and mechanical), and specialty paper products manufacture. The economics of solid waste management and the impact of environmental legislation on solid waste management are discussed. Alternatives for existing solid waste management practices are examined. Case studies are presented showing solid waste management practices at mills producing bleached kraft pulp, paperboard, and converted paper products; neutral sulfite semichemical pulp, waste paper pulp, and corrugating medium; bleached kraft pulp and coated and uncoated papers; groundwood and bleached sulfite pulps and coated and uncoated papers; and unbleached kraft pulp and linerboard. **REDUCTION OF EFFLUENT POLLUTION AT THE ARKHANGEL'SK MILLS (SNIZHENIE ZAGRYAZNENNOSTI STOCHNYKH VOD NA ARKHANGEL'-SKOM KOMBINATE),**
Arkhangelsk Kombinat (USSR).
A. M. Rudakova.
Bumazhnaya Promyshlennost, No 3, p 23-24, March 1975.

Descriptors: *Water pollution control, *Pulp and paper industry, *Waste water treatment, *Water consumption, Sulfite liquors, Pulp wastes, Biological treatment, Sludge treatment, Dewatering, Drying, Evaporation, Water purification, Foreign countries, Pollution abatement, Water pollution sources, Industrial wastes, Wastes, Waste treatment, Recycling, Water conservation, Industrial water.
Identifiers: Woodroom effluents, Paper mills, Board mills, Soviet Union(USSR).

The Arkhangel'sk mill is actively engaged in research on pollution abatement. During the last decade large sums were invested in effluent purification equipment and much work had been done to reduce the volume of effluents as well as their pollution load. The capacity of the biological purification plant has been increased, a plant for dewatering and thermal drying of sludge has been constructed, the evaporation plant has been modernized to permit the full utilization of spent pulping liquors, including spent liquor from the neutral sulfite semichemical process, and equipment has been installed for the purification of bark-containing effluent from the wood preparation room. At the paper and board mills the consumption of fresh water has been reduced. (Stapinski-IPC)

Descriptors: *Efficiencies, *Waste water treatment, *Flotation, Waste treatment, *Performance, Optimization, Water pollution treatment, Water purification, Sewage treatment, Air, Equipment, Valves, Construction, Design, Separation techniques, Water pollution treatment, Water pollution control, Filters, Aeration.
Identifiers: *Savealls.

An analysis of the operation of flotation savealls operating on the principle of pressure flotation has shown that the cause of the low efficiency of this type of equipment is an insufficient amount of air bubbles in the flotation part where the bubble-particle complexes rise to the surface. This is due mainly to insufficient air dissolved in the effluent, inadequate construction of the reducing valve which lowers the effluent pressure to atmospheric, intense coalescence of air bubbles in the receiving chamber, and strong currents generated when the effluent goes from the receiving chamber to the floatation chamber. The construction decribed in this article eliminates the above drawbacks and increases the efficiency of existing savealls. To dissolve air in the effluent and remove the excess air, a head tank was developed which makes it possible to fully saturate the effluent within 1-2 min. A specially constructed reducing valve corrected the problem of lowering the pressure to atmospheric and a redesigned receiving chamber shortened the residence time of the aerated effluent in the chamber to 3-5 sec, so that no coalescence of the air bubbles takes place. The efficiency of the savealls has bee increased from 50-79% to 85-96%. A diagram of the new saveall is given. (Stapinski-IPC)

**ACTIVATED SLUDGE,**
California Univ., Davis.
E. D. Schroeder.
Journal Water Pollution Control Federation, Vol 47, No 6, p 1261-1269, June, 1975. 101 ref.

Descriptors: *Reviews, *Bibliographies, *Activated sludge, *Waste water treatment, Industrial wastes, Phosphorus, Nitrogen, Nutrient removal, Design, Operations, Mathematical models, Aeration, Waste treatment, Water pollution control, Pulp wastes, Control, Heavy metals, Biochemistry, Microbiology, Toxins, Sludge treatment, Sludge disposal, Economics, Costs.

The 1974 literature on the treatment of waste waters by the activated sludge process is reviewed. Topics discussed include: process models, control, and design and operation of activated sludge plants; microbiology and biochemistry of the process; removal of heavy metals and effects of toxicants; industrial waste water treatment; aeration; nitrogen and phosphorus removal; sludge thickening and disposal; and costs of activated sludge plants. Refinery, pulp and paper, and distillery wastes are cited as examples of some of the waste materials that are being treated by the activated sludge process. (Witt-IPC)

**CELLULOSE DEGRADATION IN WASTE WATER TREATMENT,**
Uppsala Univ. (Sweden). Inst. of Biochemistry.
N. Edberg, and B. V. Hofsten.
Journal Water Pollution Control Federation, Vol 47, No 5, p 1012-1020, May, 1975. 12 fig, 19 ref, 1 tab.

Descriptors: *Cellulose, *Biodegradation, *Waste water treatment, Bacteria, Organic compounds, Degradation(Consumption), Water pollution sources, Activated sludge, Fibers(Plant), Lignins, Testing procedures, Gravimetric analysis, Oxygen demand.
Identifiers: Sulfite pulp.

A considerable part of the organic matter in municipal waste water consists of cellulose fibers. A method of studying the bacterial degradation of these fibers has been developed. Sample fibers (sulfite pulp fibers) are enclosed in an inert nylon bag and immersed in environments encountered in an activated sludge process. The amount of degradation is determined by periodically retrieving the bags and weighing them. Such experiments show that degradation of cellulose fibers results in increased oxygen consumption. Fibers that are slowly degraded because of high lignin content or slow bacterial growth play only a minor role in the oxygen balance. (Witt-IPC)

Identifiers: *Japan, Alum, Sodium hydroxide, Wood supply, Mill site, Linerboard mill, Newsprint mill, Kraft linerboard, Newsprint, Board mills.

A new mill producing virgin kraft linerboard and newsprint was built on Shikoku Island beside the existing mill of Taio Oaper Co. which produces corrugating medium and fine papers in addition to linearboard and newsprint. Major problems dealt with before the expansion included wood supply, mill site, fresh water supply, and effluent treatment. Wood is imported from the U.S. Pacific Northwest, Australia, U.S.S.R., and Southeast Asia. A mill site was obtained by dredging and building on reclaimed land. Additional fresh water was not readily available, but installation of extensive effluent treatment systems permitted reuse of much of the water. The effluent intended for recycling is first sent to a settling basin for reduction of suspended solids and then to an activated sludge aeration basin. It then passes through two second-stage settling basins where alum, caustic soda, and flocculating agents are added. The effluent for recycling is then sent to a filter. The remaining effluent goes to two clarifiers where insoluble compounds which precipitate out as a result of the chemical reactions are removed. Treatment of effluent for discharge into the sea is similar but with elimination of the activated sludge treatment. Fresh water consumption has been reduced by one-half, i.e., to 35 cu m/ton of finished paper, after installation of these treatment systems. (Sykes-IPC)

**ANALYTIC CHARACTERIZATION OF SEWER LOADING BY SPENT LIQUORS OF THE PULP INDUSTRY (ANALYTISCHE KENNZEICHUNG DER BELASTUNG DER VORFLUTER DURCH ABLAUGEN DER ZELLSTOFFINDUSTRIE),**
W. Leithe.
Das Papier, Vol 29, No 5, p 195-197, May, 1975. 1 ref.

Descriptors: *Pulp wastes, *Biochemical oxygen demand, *Chemical oxygen demand, Analytical techniques, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Oxidation, Waste water(Pollution), Water pollution, Organic loading, *Pollutant identification, *Waste water treatment.
Identifiers: Total organic carbon.

Spent liquors from pulp production burden the effluent predominantly via the oxygen demand during biological decomposition of organic material. For rapidly decomposing materials, especially carbohydrates, 5-day DOD determination is applied, for which a simplified differential method is indicated. For the determination of the total (long-term) oxygen demand (COD), the postassium dichromate method is adequate. A value especially suited for relative determinations is the total organic carbon content (TOC value). It advantage consists in the short testing time and the completeness of the oxidation. However, a direct comparison with the 5-day BOD is not possible, since the COD/TOC relationship is variable. (Speckhard-IPC)

Identifiers: *Evaporator condensates, Acetic acid, Formic acid, Furfural, Sulfur dioxide, Sulfite pulp mills.

Studies are reported concerning biochemical treatment (activated sludge process) of evaporator condensates from sulfite pulping using a model condensate containing acetic acid, formic acid, furfural, and sulfur dioxide. The condensate was shown to be highly digestible following dilution in the presence of a nitrogen and phosphorus source, although the morphology of the biological system was changed considerable from the conventional concept of an activated sludge process. Furfural, which should be regarded as especially dangerous with respect to effects on receiving waters, was completely eliminated by the biochemical treatment. (Speckhard-IPC)

Identifiers: *Rotating biological disk.

The rotating biological disk (RBD) system offers a novel technique for the treatment of kraft mill effluents. It combines simplicity, reliability, and efficiency of operation into one system. To verify the advantages claimed by this system, a laboratory study was undertaken with a 7 liter bench-scale RBD unit. Combined bleached kraft mill effluents (5-day BOD = 165 to 185 mg/liter) were tested at retention times of 2 to 16 hr, equivalent to hydraulic loadings of 0.26-0.33 gal/sq ft/day, respectively. The BOD removal was better than 90%. The BOD of the treated effluent was less than 20 mg/liter and the suspended solids content was less than 33 mg/liter throughout. All acute toxicity to fish was removed at retention times as short as 2 hr. The high efficiency obtained implies that the system could handle loadings larger than 0.00046 lb BOD/sq ft/day without significant change in effluent quality. The RBD system was simple to operate requiring little attention. Sludge built up rapidly on the disk surface. No foaming problems occurred and no sludge washout was experienced. Capital costs for a 10 million gal/day plant are $6000,000-1,000,000. (Witt-IPC)

Identifiers: Alum.

Effluents from bleached and unbleached kraft and sulfite cooks were treated for color removal by pH adjustment, dialysis, activated carbon adsorption, alum coagulation, lime treatment, and activated sludge treatment. The color of all waste waters changed over all pH ranges. Dialysis indicated that color substances in bleaching wastes have higher molecular weights than those in pulping effluents. Alum and lime treatments effectively removed bleaching and kraft effluent color. Activated carbon was most effective in decoloring neutral sulfite semichemical effluents. Activated sludge treatment of pulping wastes intensified rather than diminished the color. In general color bodies of all wastes did not parallel the other characteristics of the effluents, such as Mn-based COD, 5-day BOD, and absorbance at 280 nm. Nine types of wood cooking and bleaching wastes were irradiated with ultraviolet radiation (mercury lamp) to reduce their color. Color reductions varied with different wastes. The colors of kraft and sulfite mill effluents were intensified at the start of irradiation, then reduced. Sulfite effluents decolored faster than kraft effluents. The colors of bleaching and neutral sulfite semichemical effluents were reduced from the start of irradiation. The Mn-based COD and absorbance at 280 nm of all wastes were reduced from the start. The pH of irradiated wastes dropped at the start, showing formation of some acids, and then rose gradually with further degradation of acids. Isolated lignin preparations subjected to the same treatment showed the same patterns of color reduction as the original wastes. thern Paper Co. operates an integrated l kraft-neutral sulfite semichemical pulp mill at Cedar Springs, Georgia. The ment system includes a 300 ft diameter 00 million gal aerated lagoon, and a 160 holding pond. The latter is necessary ill discharges into a river regulated by a ric navigation dam. A study was made tive methods of increasing effluent solids removal. The investigation inagulation analyses of the effluent solids, clarification of aerated stabiliza- effluent, and multi-media filtration of t from the settling basin. Both sedimenmulti-media filtration appeared capable ng reductions in effluent suspended as noted that there was little or no orval in conjunction with the suspended oval. Economic analyses indicate that ne of the systems might make them imr full-scale operation. (Sykes-IPC)

EUSE IN A PAPER REPROCESSING

Univ., Norman. School of Civil End Environmental Science.
, G. Reid, P. Law, C. Hogan, and J. ger.
Environmental Conference, Denver, May 14-16, 1975, Preprinted s (TAPPI, Atlanta, Georgia), p 147-159. 8 tab.

Descriptors: *Water reuse, *Pulp and paper industry, Water conservation, Water supply, *Waste water treatment, Costs, Productivity, Corrosion, Slime, *Oklahoma, Economics, Recycling, Water costs, Water demand, Water requirements, Water pollution control, Water pollution sources, Quality control, Closed conduit flow, Drainage.
Identifiers: Organic felt, Waste paper, Asphalt felt, Roofing felt.

The feasibility of water reuse was explored at Big Chief Roofing Co. (Ardmore, Oklahoma), a waste paper-reprocessing plant manufacturing organic felt (most of which is saturated with asphalt and converted to shingles and other roofing products). Before the project began, the mill was discharging 125 gal/min of water. Normal operation is now zero discharge, with approximately 12 gal/min of fresh water replacing evaporative losses. A favorable cost/benefit ratio experienced at the mill demonstrates advantages of in-plant control over end-of-pipe treatment. Economic benefits observed during zero-discharge operation include reduced water supply and waste water treatment costs, improved yield, improved drainage, and greater capacity of the dryer section due to increased operating temperatures, and resultant increased production. The benefits were partially offset by shorter felt lives, increased corrosion and slime control costs, and process modification cost. No degradation of product quality was noted. (Sykes-IPC)

ORGANIC COMPOUNDS IN PULP MILL LAGOON DISCHARGE,
Washington Univ., Seattle. Coll. of Forest Resources.
B. F. Hrutfiord, T. S. Friberg, D. F. Wilson, and J. R. Wilson.
In: TAPPI Environmental Conference, Denver, Colorado, May 14-16, 1975, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 181-184. 3 fig, 6 ref, 6 tab.

Descriptors: *Pulp wastes, *Organic compounds, *Aerated lagoons, *Discharge(Water), Wastes, Industrial wastes, Water pollution sources, Phenols, Acids, Liquid wastes, Aromatic compounds, Organic wastes, Waste treatment, Waste water treatment, Water pollution treatment, Water pollution control, Pulp and paper industry, *Washington, Pacific Northwest US.
Identifiers: Terpenes, Resin acids, Fatty acids, Sugar acids, Alpha-terpineol, Camphor, Kraft mills.

Organic compounds entering and leaving aerated lagoons of Weyerhaeuser Company's bleached kraft mill at Everett, Washington, have been identified and determined quantitatively. The compounds found were terpenes, resin and fatty acids, phenols, and sugar acids. The terpenes, resin and fatty acids are similar to those present in the wood species being pulped. About 8 ppm total terpenes were found in the lagoon influent and 1 ppm or less in the effluent. Alpha-terpineol was the major compound entering the lagoon, and camphor was the main terpene in the effluent. The total resin acid concentration entering the lagoon was 3.2 ppm, with 0.6 ppm leaving. Fatty acids were lower both entering and leaving the lagoon. Sugar acids were entering at about 100 ppm total, but were usually eliminated in the lagoon. Terpenes can be controlled by in-process stripping, and the other compounds can be partially controlled by in-plant spill containment. (Sykes-IPC)

PLANT PERFORMANCE USING DISSOLVED OXYGEN CONTROL,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
J. F. Roesler.
Journal of the Environmental Engineering Journal, Vol 100, No EE5, Proceedings of ASCE, Paper No. 10841, p 1069-1076, October 1974. 6 fig, 2 tab, 2 equ, 3 ref.

Descriptors: *Waste water treatment, *Aeration, *Automation, *Dissolved oxygen, *Water pollution control, *Environmental engineering, Frequency, Distribution, Sludge, Instrumentation, Air demand, Suspended solids, Graphical analysis, Oxygen requirements, Operations, *Performance, Control, Treatment facilities, Washington.
Identifiers: Renton(Wash).

The Renton Sewage Treatment Plant offered a unique opportunity to obtain unbiased, comparative, performance evaluation data for both automatic and manual dissolved control. The data were ranked in ascending order and plotted on logarithmic probability paper to obtain a frequency distribution. The parameters that were considered were BOD in the effluent, BOD and COD removals, sludge volume index, and settleability. All the parameters showed an improvement when the operation was changed to automatic dissolved oxygen control with the exception of COD values, which reflected little change. A rate constant that considered BOD removals, hydraulic flow, and the concentration of mixed liquor suspended solids was used to determine the overall efficiency of the process. In changing from manual to automatic dissolved oxygen control, the rate constant changed from 0.0260 - 0.1018, which reflects an improvement of 391%. This study indicates that automatic DO control can maintain excellent operational performance in a conventional activated sludge plant. The operators claim that there are less problems with filamentous bulking and that the sludge is easier to settle and handle. (Bell-Cornell)

WATER-QUALITY REQUIREMENTS FOR THE PETROLEUM INDUSTRY,
Neptune MicroFloc, Inc., Corvallis, Oreg.
R. H. Evers.
Journal of the American Water Works Association, Vol 67, No 2, p 60-64, February 1975. 2 fig, 10 tab, 5 ref.

Descriptors: *Water reuse, Water quality standards, Oil, Waste water, Organic compounds, Waste discharge, Industrial wastes.
Identifiers: *Petroleum industry.

A review of water reuse, water quality requirements, current effluent standards and treatment practices for water from the petroleum refinery industry is given. Water usage is divided into cooling and condensing, boiler feed, and process and other uses. Water quality guidelines have been compiled by the American Petroleum Institute. Requirements vary depending upon the future use of the recovered water, whether for potable use or washdown purposes. General guidelines indicate that water should be clear, colorless, free of iron, manganese, hydrogen sulfide, and organic growth. Tables illustrate the quality characteristics of untreated cooling waters, water use and reuse by refinery classification, raw water and reused water for steam and processing, guidelines for boiler feed water tolerances and cooling water tolerances, water quality requirements of water at point of use for the petroleum industry and treatment systems used for refinery raw waters. Effluent standards as established by the EPA are described. Future plans for waste water discharge and for reuse within the industry are being made. (Prague-FIRL)

MANUAL FOR PREPARATION OF ENVIRONMENTAL IMPACT STATEMENTS FOR WASTEWATER TREATMENT WORKS,

**FACILITIES PLANS, AND 208 AREAWIDE WASTE TREATMENT MANAGEMENT PLANS,**
Environmental Protection Agency, Washington, D.C. Office of Federal Activities.
P. L. Cook, and N. Cronin.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-235 280, $3.75 in paper copy, $2.25 in microfiche. EPA Report, August, 1973. 35 p, 3 fig.

Descriptors: *Federal jurisdiction, *Environmental effects, *Treatment facilities, Waste water treatment, Waste discharges, Publications, Pollutant effects, Planning, Publications.
Identifiers: *Environmental Impact Statements.

Detailed guidance is given for the preparation of Environmental Impact Statements (EIS) on waste water treatment works. The National Environmental Policy Act of 1969, Public Law 91-190, requires all Federal agencies to prepare environmental impact statements before acquiring Federal funds to produce a project. The requirements of the Council on Environmental Quality (CEQ) are outlined. A flowchart for the systematic gathering of information for the EIS has been drawn. Various treatment alternatives are listed, depending upon whether the facility is a treatment work, a facilities plan, or a 208 plan. Techniques such as treatment and discharge to surface waters, waste water reuse, land application, and sludge disposal alternatives are described. Alternatives are given. The review of the EIS by a Federal or State Agency representative is also discussed. (Prague-FIRL)

**PROCESS DESIGN MANUAL FOR SLUDGE TREATMENT AND DISPOSAL.**
Environmental Protection Agency, Washington, D.C. Technology Transfer Staff.
Report EPA 625/1-74-006, October, 1974. 389 p, 155 fig, 105 tab.

Descriptors: Publications, *Capital costs, *Operating costs, *Maintenance costs, *Sludge treatment, *Sludge disposal, *Design criteria, Pilot plants, Liquid treatment, Reviews, Systems analysis, Waste treatment, Treatment facilities.

A review is provided of current sludge processing technology as well as procedures to be considered, modified, and applied for specific design situations and unusual conditions. Regulations now require the design and construction, as well as cost-effective operation, of municipal treatment facilities to remove at least 85% of influent BOD. Discussed are the capital, operating, and maintenance costs for both primary and higher levels of treatment. Since higher treatment levels are more costly, there is an economic incentive for optimal design. Advanced waste treatment sludges and complex industrial wastes present unique problems. Secondary treatment produces biological sludges in increasing amounts. Because of a lack of regulations on sludge disposal, design has focussed on liquid treatment handling. This has caused the sludge disposal methods, often disproportionate in terms of cost, to be inefficiently designed. Newer liquid treatment and sludge treatment unit processes in secondary plants are better interrelated and should be studied together. Optimum innovative design by the engineer is discussed. It is recommended that the designer: develop and maintain a thorough knowledge of various sludge treatment unit processes; continually study plant operation for feedback for future cost saving design modifications; study pilot plants of alternate prescreened systems; and use systems analysis to compare alternate complete systems. (Prague-FIRL)

**GRAVITY DEWATERING OF METAL HYDROXIDE SLUDGES,**
Permutit Research and Development Center, Princeton, N.J.
J. R. Anderson, L. B. Luttinger, and W. L. Schwoyer.
Reprint from Plating, December 1972. 5 p, 10 fig.

Descriptors: *Dewatering, *Metals, *Hydroxides, *Sludges, Catalysts, Coagulation, Precipitation, Filters, Concentrations, Flocculation, Neutralization, Flotation, Settling, Turbulence, Reynolds number, Slurries, Clarification, Laminar flow, Drag, Influent, Discharge, *Waste water treatment, *Sludge treatment.
Identifiers: Backwash.

The pH adjustment of metal finishing wastes to the range where they will be acceptable for discharge to a sewer or stream generally results in the formation of a precipitate, usually metal hydroxide. The concentration of a hydroxide, several hundred ppm, is usually too low for direct removal by most mechanical dewatering devices. The normal progression of treatment is to concentrate from the several hundred ppm range to the 0.5 to 1 per cent range by flotation or settling devices; to further dewater to the 8 to 15 per cent range by use of a liquid-solid separator; and finally secondary dewatering to the 13 to 20 per cent range by means of a press. The material at this point is a damp solid which can be hauled to a land fill or another source of ultimate disposal without drippage. The three types of devices are discussed. This system is equally applicable to crystalline solids as well as amorphous flocs. (Rowe-Vanderbilt)

**COPING WITH URBAN RUNOFF IN THE UNITED STATES,**
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
R. Field.
Water Research, Vol 9, No 5/6, p 499-505, May-June 1975. 2 tab, 8 ref.

Descriptors: *Urban runoff, *Combined sewers, *Separated sewers, *Storm water, *Overflow, Waste water disposal, Filtration, Flow measurement, Infiltration, Sewage treatment, Water storage, Flow, Regulation, Disinfection.
Identifiers: Microstraining, Dissolved-air flotation, Porous pavement, Rotating biological contractor.

Combined sewers are a source of water pollution problems, but even flows of stormwater alone can seriously affect water quality. Sewer separation is very costly and solves only about 50% of the problem. Current approaches involve control of combined overflows, treatment, and combinations of the two. Control can involve maximizing of treatment with existing facilities, improvement of regulator maintenance, control of infiltration and extraneous inflows, surface sanitation, and addition of flow-increasing polymers, as well as flow regulation and storage, use of porous pavement, and vacuum and pressure-type sewer systems. A number of treatment methods are being evaluated. The most promising are microstraining at high rates, ultrahigh rate filtration on various media, screening and dissolved-air flotation, and the rotating biological contractor. Disinfection processes also can be adapted to storm flows. (Lardner-ISWS)

**NCENTRATION OF DILUTE WASTE EAMS BY ION EXCHANGE TECHNIQUES,**
nutit Research Center, Princeton, N.J.
Hamilton.
Proceedings of the 27th Industrial Waste Con- nce, May 2-4, 1972, Purdue University, yette, Indiana, Engineering Extension Series 41, Part 1, p 80-84. 4 fig, 2 tab, 3 ref.

criptors: *Waste water treatment, *Ion ange, Resins, Separation techniques, Liquid es.

minimum regenerant waste volume produced he various types of ion exchange resins is olished and correlated with the respective exchange capacities in order to determine a centration factor' for any specific influent entration. This 'concentration factor' can be used as a guide for deciding if ion ange is a suitable treatment technique. The eration characteristics for both the weak acid n type resin and the weak base anion type are very similar. The weak group resins can generated with 1.1 times the stoichiometric nt of regenerant and are easily rinsed with 2 ed volumes. The ease of regeneration of the group resins has a significant process ad- ge over the strong group resins in that the erant quality can be very poor and yet still be ently used and reused. Although the concen- n factor versus influent concentration for al types of resin is illustrated and provides a to the feasibility of ion exchange as a treat- method, engineering and design will require for determining capacity and regeneration ef- cy to be carried out for all waste streams in to compensate for each waste stream's in- ial characteristics. **ATMENT OF MILK TRUCK WASHING TES BY ANEROBIC DIGESTION,**
elaer Polytechnic Inst., Troy, N.Y. Bio-En- nental Engineering Div.
Aulenbach, and R. V. Hallock.
oceedings of the 27th Industrial Waste Con- ce, May 2-4, 1972, Purdue University, ette, Indiana, Engineering Extension Series 1, Part 1, p 126-136. 1 fig, 6 tab, 1 ref.

iptors: *Dairy industry, *Waste water treat- *Aerobic treatment, Transportation, New *Anerobic digestion, Farm wastes.
fiers: *Milk truck washings.

Wastes from washing trucks delivering milk to the Hood Milk Transfer Station at Eagle Bridge, New York, contain 10% caustic, a specially formulated high phosphate detergent, a mild neutralizer, a solution containing sodium hypochlorite, and total a waste flow of approximately 5000 gpd of high alkaline discharge. Waste analysis showed an average 11.15 pH value, BOD mean value of 779, COD approximately double the BOD, and total solids of a mean value of 1768, half of which were volatile. They contain a barely adequate nitrogen supply for aerobic decomposition of the BOD while total phosphate is present in excess. A basic digestion system is illustrated and operations methodology is discussed and compared. The loadings of the two most representative systems were in the range of 0.008 lbs of BOD cu ft/day. The septic effluent from the digestor underwent a one-hour aeration, sufficient to raise the DO level and dispel odors, but does not further reduce the organics nor produce sludge. Anaerobic digestion for milk truck washings can effect a better than 85% reduction in BOD and COD at a 7-day detention time at 36C, by either single or two stage digestion. Additional nitrogen is not necessary for successful treatment. (Auen-Wisconsin)

**SLUDGE DISPOSAL ON AGRICULTURAL SOIL,**
Ohio State Univ., Columbus. Dept. of Agricultural Engineering.
R. K. White, and M. Y. Hamdy.
In: Proceedings of the 27th Industrial Waste Conference, May 2-4, 1972, Purdue University, Lafayette, Indiana, Engineering Extension Series No 141, Part 1, p 191-201. 3 fig, 1 tab, 9 ref.

Descriptors: *Waste disposal, *Sludge disposal, Agriculture, *Soil disposal fields, Application equipment, Technology, Transportation, *Waste treatment, Application methods, Costs, Facilities, Mathematical models.

Alternative equipment and processes in a system for the treatment, transportation, and disposal of sludge on agricultural soil is delineated. Selection factors, such as concentration of nitrogen or toxic elements in the sludge, are considered as constraints on a 'typical' sludge disposal system. Other cost and system constraints are considered relative to annual sludge production, seasonal distribution, sludge characteristics, geography and climate, and government regulations. A typical sludge disposal system is diagrammed, different treatment processes (depending on the disposal method) are discussed, and the selection of the proper transportation mode weighed. A mathematical model is proposed for a disposal system which puts the various concepts and constraints in a qualitative form that lends itself to optimization techniques. If the cost and constraint coefficients are constant over a sufficiently long period of time, linear programming techniques could be utilized; if one or most cost coefficients of a given process change with the amount of sludge processed, or if the constraints on a given process change with the amount of sludge processed, the resolution required nonlinear programming techniques; if the cost function or constraints change with time, the solution of the mathematical model would require dynamic programming techniques. W75-10674

**HEAVY METALS REMOVAL FROM WOOD PRESERVING WASTEWATER,**
Russell and Axon, Inc., Daytona Beach, Fla.
E. H. Teer, and L. V. Russell.
In: Proceedings of the 27th Industrial Waste Conference, May 2-4, 1972, Purdue University, Lafayette, Indiana, Engineering Extension Series No 141, Part 1, p 281-286. 2 fig, 7 tab, 7 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Heavy metals, *Wood preservatives(Pesticides), Chromium, Copper, Arsenicals(Pesticides), Fluorides, Aquous solutions, Phenols, Ammonia, *Georgia.

In 1971, the Dixie Wood Preserving Company at Thomson, Georgia installed the first of its kind wastewater treatment system in the wood preserving industry, subsequently approved by the Georgia Water Quality Control Board. The design objective was to treat the concentrated waste excess from two 5000 gallon tanks so that further degradation of the Dixie Pond would cease; and when the treater is not needed for the more concentrated wastes, treat the pond water itself to lower the level to eliminate discharge and to remove toxic materials from the pond in order to enhance its biological viability. While the treater must remove chromium, copper, arsenic, fluorides, phenols, and ammonia from the wastewater, the effluent also contains some residual oxygen demand from the wood steaming and a vegetable dye used to mark the wood. Although these are negligible relative to the quantities of toxic materials, it is planned to eventually use the pond as a final polishing pond for the treater effluent. This will provide oxygenation and protection for downstream users from eutrophication induced by traces of ammonia-nitrogen and phosphate. The treatment system is described. The total investment cost was $50,000; the treater itself, labor and materials, cost below $30,000. (Auen-Wisconsin)
W75-10675

**RECLAMATION OF TEXTILE PRINTING WASTEWATERS FOR DIRECT RECYCLE,**
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
W. M. Kachel, and T. M. Keinath.
In: Proceedings of the 27th Industrial Waste Conference, May 2-4, 1972, Purdue University, Lafayette, Indiana, Engineering Extension Series No 141, Part 1, p 406-419. 10 fig, 4 tab, 8 ref.

Descriptors: *Industrial wastes, *Waste water treatment, *Water reuse, *Pigments, *Separation techniques, Dyes, Flocculation, Design flow, Cost comparison, Chemical precipitation, *Recycling.
Identifiers: *Textile printing effluents.

Technical and economic feasibility studies are described for textile printing wastewater pigment destabilization through pH control (which proved inapplicable) and destabilization with metallic salts. A schematic flow diagram of a proposed printing wastewater renovation and reclamation system is detailed, which provides for the addition of a metallic coagulant and caustic to the printing wastewaters for destabilization, for the mixing and flocculation of the destabilized suspension for particle aggregation, for flotation for solids/liquid separation, for recycling of the renovated water to the printing machines, for addition of make-up water, and for solids disposal by incineration. Provision is also made in the diagram for blowdown of dissolved solids and varsol, if required. Clarification efficiencies in excess of 98% were attained when either ferric chloride, ferric sulfate, or aluminum sulfate was employed as the coagulant, supplemented by pH control. Projected costs for three system alternatives, indicate that the alternative which centers on the water reuse concept has distinct economic advantages over those in which treated wastewaters are discharged to a receiving stream. Process costs for reclamation and reuse of these waters for printing equipment rinsing operations were estimated at 2.32 cents/1000 gal. (Auen-Wisconsin)
W75-10676

**LAGOONS PLUS SPRAY IRRIGATION FOR EFFECTIVE BEAN CANNERY WASTE TREATMENT,**
Syracuse Univ., N.Y. Dept. of Civil Engineering.
N. L. Nemerow, and J. D. Scott.

In: Proceedings of the 27th Industrial Waste Conference, May 2-4, 1972, Purdue University, Lafayette, Indiana, Engineering Extension Series No 141, Part 1, p 555-562. 5 fig, 5 tab, 3 ref.

Descriptors: *Waste treatment, *Waste water treatment, *Food processing industry, Beans, Canneries, Sprinkler irrigation, Sewage lagoons, Organic wastes, Odors, Oxidation lagoons, New York, Industrial wastes.
Identifiers: Bean cannery wastes, Eden(NY).

The design of a three-stage lagoon system for treating bean cannery effluents was based on the following criteria: (1) The organic wastes were readily oxidizable, (2) adequate land was available, (3) no municipal treatment facilities were accessible, (4) best usage of the receiving stream was for irrigation water, and (5) a short, 10-week, packing season. The ponds were built at varying depths and over a four year period effected removals of 68-85% BOD and 60-85% suspended solids, which was ample to prevent odors. Raw waste BOD, COD, and SS were about 450, 1000, and 300 mg/l, respectively, and were reduced by the ponds to values of approximately 110, 127, and 70 mg/l. The daily hydraulic raw waste loading amounted to 216,000 g/day. The total waste load was 810 lbs of BOD per day of the three pond system with the unit loading on the entire system of 260 lbs of BOD per acre/day. The pond system-treated effluent was successfuly spray irrigated on a rye grass field of loadings of 72,000 gallons per acre/day over a 3 acre field at a BOD load of 67 lbs/acre/day. The operational problems and corrective measures taken are described. (Auen-Wisconsin)

**DISPOSAL OF LIQUID EFFLUENT BY LAND IRRIGATION AT LAGRO CELOTEX PLANT,**
Celotex Corp., Lagro, Ind.
C. D. Synder.
In: Proceedings of the 27th Industrial Waste Conference, May 2-4, 1972, Purdue University, Lafayette, Indiana, Engineering Extension Series No 141, Part 1, p 563-568.

Descriptors: *Waste water treatment, Irrigation, *Industrial wastes, *Irrigation systems, *Indiana, Sprinkler irrigation, Costs, Irrigation design, Drainage, Organic wastes, *Waste disposal.
Identifiers: *Land irrigation, Lagro(Ind).

The Celotex plant at Lagro, Indiana disposes their effluent by land spraying. The effluent contains residues of organic matter from the production of building materials products. The major raw materials used are steel mill slag, foundry coke, gravel, clay, and starch. The process effluent is collected by the usual system of floor drains and underground pipes converging to one stream which is directed to a transfer pump. The spray irrigation system is installed on a 12-acre, gently sloping field. The complete disposal system consists of two pipe networks, one of which distributes the effluent to a series of sprinkler heads, while the other pipe network underlays the entire irrigation field to remove the underground drainage. The underdrain discharge joins an open ditch with the resulting flow following both open and closed ditches to the Wabash River. The design, operation, maintenance, and costs are detailed. Tests indicated that the quality of the effluent from this disposal system compares favorably, or is superior to, the river water supply. Two other spray irrigation systems installed by this corporation, one in Michigan, purified the waste effluent 99% and the Pittston, Pennsylvania plant, has used this disposal system for 10 years with satisfactory results. (Auen-Wisconsin)

**VACUUM FILTRATION COST OPTIMIZATION,**
Colorado Univ., Boulder. Dept. of Civil and Environmental Engineering.
E. R. Bennett, K. D. Linstedt, and D. A. Rein.
In: Proceedings of the 27th Industrial Waste Conference, May 2-4, 1972, Purdue University, Lafayette, Indiana, Engineering Extension Series No 141, Part 2, p 649-664.

Descriptors: *Optimization, *Sludge treatment, *Sewage treatment, Vacuum drying, Sludge disposal, Capital costs, Operating costs, Dewatering, Costs, *Filtration, *Waste water treatment.
Identifiers: *Vacuum filtration.

In a typical large-scale operation the solids processing system is often comprised of vacuum filtration facilities for sludge dewatering with associated incineration or landfilling capability for disposal of the dewatered sludge. The optimum operating conditions of a vacuum filter are dictated by the total sludge processing and disposal systems. The relationship between machine variables and input and output parameters are shown. The solids processing costs are very sensitive to adequancy of design and optimization of operation. This sensitivity develops in several areas of the sludge processing system through: the use of relatively large chemical doses for sludge conditioning; the effect of dewatered sludge characteristics on the capacity and auxiliary fuel requirements for incineration; and, moisture consideration in defining the conveyance capacity and costs for land disposal. This study investigated the relationship of the dose, yeild, and cake moisture variables in a vacuum filter operation, with emphasis on the means of improving cake dryness. Filtration costs and disposal costs are analyzed in detail. The vacuum filter operation is fairly insensitive to most of the machine parameters. The major factors influencing the cost of the process are the amount of activated sludge in the sludge mixture and the solids content of the feed sludge. (Auen-Wisconsin)

**DISPOSAL OF DIGESTED SEWAGE SLUDGE BY LANDFILL,**
Washington Univ., Seattle. Dept. of Civil Engineering.
B. W. Mar, and C. Henry.
In: Proceedings of the 27th Industrial Waste Conference, May 2-4, 1972, Purdue University, Lafayette, Indiana, Engineering Extension Series No 141, Part 2, p 673-678. 9 ref. EPA WPRD-180-01(R).

Descriptors: *Waste disposal, *Landfills, *Sludge disposal, *Washington, Land development, Economic feasibility, Intertidal areas, Seashores, Feasibility studies, *Waste treatment.
Identifiers: Puget Sound(Wash), Seattle(Wash), Demonstration project.

The purpose of this demonstration project was to develop a process that would employ wet digested sewage sludge to reclaim seashore land, particularly attrative since the treatment plant is located on the shores of Puget Sound and Seattle had expressed an interest in developing a parkway along that intertidal zone. The research goal was to investigate the economic feasibility and environmental acceptability of this concept. Laboratory feasibility studies investigated the dewatering and settling capabilities of the sludge. Bench scale studies investigated the problems and characteristics of centrifuging digested sludge and explored the natural drying of sand/sludge mixtures, consolidation of the mixtures, pollutional aspects of the fill, and the operation of the dewatering facility. Centrate treatment either by addition of chemicals to increase solids recovery in the cake or by direct treatment of centrage will double dewatering costs, yet the effectiveness of the chemicals is not readily predictable. A stable fill can be developed using 50% water content sludge cake. Leachate impacts of the fill can be minimized by dewatering the sludge to at least 50% solids. Public health and safety hazards were unresolved. It is recommended that the fill should be monitored for five years before this process is evaluated. (Auen-Wisconsin)

**TREATABILITY OF LEACHATE FROM SANITARY LANDFILLS,**
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
W. C. Boyle, and R. K. Ham.
In: Proceedings of the 27th Industrial Waste Conference, May 2-4, 1972, Purdue University, Lafayette, Indiana, Engineering Extension Series No 141, Part 2, p 687-704. 5 fig, 17 tab, 3 ref. EPA 5-R01-EC-0041.

Descriptors: *Leachate, *Landfills, *Treatment, Sanitary engineering, Biological treatment, Aerobic treatment, Activated sludge, Chemical precipitation, *Wisconsin, Anaerobic digestion, *Waste water treatment.
Identifiers: *Leachate treatment, Madison(Wis), Milwaukee(Wis).

The characteristics and the quantity of leachate generated from a sanitary landfill site are highly variable. The described laboratory studies were designed to evaluate the ability of anaerobic and aerobic biological leachate treatment by aerobic treatment of selected combinations of leachate and domestic wastewater in a simulated activated sludge sewage treatment plant; anaerobic followed by aerobic polishing; and chemical precipitation, oxidation, and coagulation. Anaerobic treatment of raw leachate provided greater than 90% BOD reduction for detention times greater than 10 days at 23-30C. Aerobic treatment also resulted in BOD removals in excess of 90% at approximately 23C and at loadings of less than 0.03 lb BOD5/cu ft/day. Foaming and poor solids-liquids separation did occur, however. Leachate could be added to domestic wastewater in an extended aeration activated sludge plant at a level of at least 5% by volume without seriously impairing effluent quality. Lime, sodium sulfide, chlorine, potassium permanganate, alum, and ferric chloride were tested. Chemicals alone will not provide efficient removal of organics, however, good removals of multivalent cations and color may be expected with lime, the oxidants, and coagulants. Chemical treatment requires high dosage and generally produces large amounts of sludge but seems to be particularly useful in treating biological process effluent. (Auen-Wisconsin)

WASTEWATER TREATMENT STOP OPHICATION OF IMPOUNDMENTS,
a Polytechnic Inst. and State Univ., burg.
rizzard, and E. M. Jennelle.
ceedings of the 27th Industrial Waste Con- e, May 2-4, 1972, Purdue University, tte, Indiana, Engineering Extension Series , Part 2, p 851-866. 9 tab, 34 ref. NSF GK-

Descriptors: *Eutrophication, *Pollution abatement, *Waste water treatment, *Waste water(Pollution), Municipal wastes, Nutrients, Water pollution sourses, Runoff, Sewage effluents, Reservoirs, Tributaries, *Virginia, Phosphorus, Nitrogen, Carbon, Drainage basins, Impoundments, Water pollution effects.
Identifiers: *Nutrient sources, Roanoke River(Va), Smith Mountain Lake(Va), Roanoke(Va).

Wastewater discharges from Roanoke, Virginia and environs account for 64% of the total phosphorus, 72% of the total nitrogen, and 54% of the organic carbon entering Smith Mountain Lake. Macronutrient yields from land drainage alone were found to be adequate to maintain eutrophication in this impoundment. A reduction in the nutrient yield from wastewater discharges will materially reduce the nutrient inflow to the lake, but this will not significantly improve water quality, as shown in the comparison of limiting concentrations if tertiary treatment of all wastewater is required. Becasue of the morphology and relative low inflow to volume relationship for this lake the movement of nutrients is slow, resulting in a high nutrient retention in the upper reaches. The continual increase in both population and industrial activity will also significantly increase the yield of metal cations and other nutrients. Calculations of nutrient yields by watershed type, by the drainage area of Roanoke River and tributaries, the wastewater loading to the basin, land runoff, and comparison of concentrations entering the impoundment to accepted limiting concentrations indicate that a program of total environmental management is needed if the recreational potential of downstream impoundments is to be preserved. **ANALYSIS OF WASTEWATER TREATMENT SYSTEMS FOR A MEAT PROCESSING PLANT,**
Iowa Univ., Iowa City. Dept. of Civil (Environmental) Engineering.
W. L. Paulson, L. D. Lively, and J. L. Witherow.
In: Proceedings of the 27th Industrial Waste Conference, May 2-4, 1972, Purdue University, Lafayette, Indiana, Engineering Extension Series No 141, Part 2, p 879-893. 3 fig, 9 tab, 5 ref.

Descriptors: *Waste water treatment, *Food processing industry, *Design, Treatment facilities, Feeds, Recycling, Activated sludge, Sludge treatment, Industrial wastes.
Identifiers: *Meat processing wastes, Animal feed supplement.

The results of a demonstration project, to determine the effectiveness of the oxidation ditch activated sludge (Pasveer) process are described. The project was located at the John Morrell and Company meat processing plant, Ottumwa, Iowa, where from 3.25 to 3.5 MGD wastewater would require treatment. The daily (5-day week) BOD loading was predicted to be 38,000 lbs. Based on the flow rate, effluent quality (BOD5) would have to be between 75 and 80 mg/l. The overall treatment plant efficiency (BOD) required would be approximately 95%. A schematic flow diagram of the plant design, a plant drawing listing the units, and plant features are given. The evaluation of the feasibility of using waste activated sludge as an animal feed supplement showed potential. The design and operation of the primary treatment units proved inadequate. More efficient grease and SS removal were needed prior to the aeration process. The tubular conveyors used were unsatisfactory as sludge removal mechanisms. The process is capable of achieving organic removals of 90-95% from meatpacking wastewater; however, effluent ammonia levels are of concern. Improvements in pretreatment, aeration system capacity, and final sedimentation were needed. Mechanical equipment should be properly located and protected to minimize icing. (Auen-Wisconsin)

**POPULATION DYNAMICS OF PROTOZOA IN WASTEWATER, AND IMPACT OF ENVIRONMENTAL CHANGES,**
Howard Univ., Washington, D.C. Bio-Environmental Engineering and Sciences Research Lab.
M. M. Varma, H. E. Finley, and G. H. Bennett.
In: Proceedings of the 27th Industrial Waste Conference, May 2-4, 1972, Purdue University, Lafayette, Indiana, Engineering Extension Series No 141, Part 2, p 994-1003. 7 fig, 2 tab, 24 ref. EPA 5P1-WP-178-02.

Descriptors: *Aquatic animals, *Protozoa, *Waste water treatment, *Sewage treatment, Animal behavior, *Environmental effects, Activated sludge, *District of Columbia, Systematics, Sewage bacteria.
Identifiers: Vorticella, Opercularia, Colpoda, Calpidium.

The relative importance of bacteria and protozoa in wastewater/sewage treatment was investigated by identifying the dominant protozoa in the various segments of the treatment process at the Water Pollution Control Plant of the District of Columbia; then the behavior of these protozoa in the secondary effluent, under uncontrolled environmental variables, with particular attention to the relation of pH was observed; followed by the behavior of the protozoa under some controlled variables. Vorticella and Opercularia were conspicuously successful in secondary effluent because of the presence of a large number of bacteria and high dissolved oxygen. Probably not only the number of bacteria present, but possibly also the kinds of bacteria present exert some influence as to which protozoa are dominant. While more research is recommended to determine the actual purification mechanism, i.e., is it catalase activity, protozoan activity, or a combination of both, and which is more important, these research results indicated that Vorticella, responsible for clarification, was dominant in secondary effluent; the death rate of Opercularia was not significantly affected by changes in pH (6.8-8.3); Vorticella was more sensitive within the same pH range; and that Opercularia population increased in number when glutamic acid was added to the medium. **DOMESTIC WASTE WATER REUSE--ASPECTS OF THE TREATMENT SYSTEM,**
Netherlands Waterworks, Rijswijk. Testing and Research Inst.
D. Kuiper, and R. Wechsler.
Water Research, Vol 9, No 7, p 655-657, July, 1975. 1 tab, 1 ref.

Descriptors: *Water reuse, *Water supply development, *Waste water treatment, *Water purification, Reclamation, Water treatment, Activated carbon, Water quality control, Reverse osmosis, *Sewage treatment, Water analysis, Potable water, *Domestic wastes, Domestic water.

The general requirements of a waste water reuse system--that it produce water meeting the highest existing drinking water standards, that it remove any conceivable pollutant, and that the process be

highly reliable--can be met now. Increasing deterioration of water supply sources requires advanced treatment processes while environmental legislation requires improved sewage treatment. From 50 to 80% of the water supplied returns as effluent. Relative independence from increasingly polluted sources could be gained by closing the cycle and reusing this water. The very high standards necessary to prevent contaminant build-up can be met by a treatment system consisting of several processes which rely on different and unrelated mechanisms working in series with overlapping functions. Overload capacity, quality control, and good design to prevent cross infection are essential. A proposed system works with effluent from conventional primary plus secondary biological treatment. This treated water is fed through lime clarification which disinfects at high pH and removes colloidal matter and calcium salts. Hyperfiltration (reverse osmosis) next removes substances with molecular weight over 200. Low molecular weight dissolved organics are next removed by activated carbon treatment. Finally, chlorine disinfection removes any residual ammonia and protects against quality deterioration. This combined sewage and water treatment process could be competitive with conventional water supplies. (Herr-North Carolina)

**WATER AND WASTEWATER FACILITIES FOR FLORIDA HOUSING DEVELOPMENTS,**
Singer Co., Bridgeport, Conn. Water Resources Div.
B. W. Valentine.
Public Works, Vol 104, No 10, p 98-99, Oct 1973. 1 tab.

Descriptors: *Waste water treatment, *Florida, *Water purification, *Water supply development, *Sewage treatment, Water quality control, Aquifers, Chlorination, Waste disposal wells, Water wells, Aeration, Sludge treatment, *Treatment facilities.
Identifiers: Delray Beach(FL), West Palm Beach County(FL).

Near Delray Beach, Florida, 3,400 residents in 3 new developments are being served by a combined water supply and wastewater treatment facility. Phase I of the project, now complete at a cost of $800,000, includes 2 water supply wells, a 1 MG reservoir for treated water, treatment facilities, and a control building. Water supply is from 2 12-inch diameter wells 150 ft deep delivering over 1 mgd. Water of the best available quality is from this depth, although treatment for hardness, filtering, and chlorination are required before it meets potable standards. Treated water is distributed over the 3,000 developed acres through 105,000 ft of main. Gravity and force mains collect wastewater which is treated in the 1 mgd plant and piped to 3 evaporation-percolation ponds. Expansion plans call for injection of treated effluent into the 'Bolder Zone Aquifer' which is already contaminated by water of high salinity, or discharge into the Atlantic Ocean. Phases II and III will more than quadruple the capacities of the Phase I construction. The control building houses water treatment equipment and controls, a laboratory, and a loading dock to serve both plants. An isolated portion of the building houses chlorination equipment to serve both. West Palm Beach County has agreed to assume ownership and operation of the facility upon completion. **STOCKHOLM PUTS SEWAGE PLANTS UNDERGROUND,**
Stockholm Municipal Services Dept. (Sweden). Div. of Treatment Plant Design.
S. Edlund, and G. E. Sandstrom.
Civil Engineering - ASCE, Vol 43, No 9, p 78-83, Sept 1973. 5 fig.

Descriptors: *Underground structures, *Waste water treatment, *Tunnel construction, Environmental sanitation, Tunnels, *Sewage treatment, Tunnel linings, Municipal wastes, Tunnel design, Engineering geology, *Treatment facilities.
Identifiers: *Sweden.

To conserve surface land and eliminate sewage odors, 3 of the 4 treatment plants in Stockholm have been built underground. The Henriksdal plant, the city's largest with a 97.8 mgd capacity, is potentially less expensive than a conventional plant would be if surrounded by a 500 m (1640 ft) buffer of expensive land to protect neighbors from the odor. Construction costs of $306/1000 gallons of plant capacity are from 1.35 to 1.45 times the cost of a similar activated sludge plant built on the surface. (Cost comparison with U.S. facilities is difficult since higher U.S. labor prices would raise costs for both surface and underground facilities.) The heating plant, digestor, and buildings for personnel and workshops are built on the surface. Below at least 10 m (33 ft) of rock cover are settling and aeration tanks which are actually chambers roughly 10 m by 10 m and up to 135 m (545 ft) long. The tanks are lined with poured-in-place concrete bolted to the rock walls and punctured to allow groundwater seepage into the tanks. Groundwater pressure prevents sewage seepage out of the tanks and tunnels. The ventilation system, using a series of tunnels and fans to exchange the underground air three times per hour, exhausts up a smoke stack along with sludge odors and diesel fumes. Air pressure is kept low in foul smelling areas of the plant to prevent odors from spreading. (Herr-North Carolina)

**LAND TREATMENT OF MUNICIPAL SEWAGE,**
K. A. Godfrey, Jr.
Civil Engineering-ASCE, Vol 10, No 9, p 103-109, Sept, 1973. 1 fig, 6 tab.

Descriptors: *Water reuse, *Waste water treatment, *Soil disposal fields, *Application methods, *Soil treatment, Treatment facilities, Oxidation, Sludge treatment, Tertiary treatment, Waste assimilative capacity, Municipal wastes, Soil chemical properties, Sanitary engineering, Michigan, Arizona.
Identifiers: *Muskegon(MI), Flushing Meadows(AZ).

Land treatment of municipal sewage, after secondary treatment and chlorination, is a viable method of tertiary treatment when designed with necessary safeguards. Used in the arid southwest to augment water supply, land treatment may be used increasingly throughout the country. Treated feedwater is applied in three ways. Spray irrigation on crops, grassland, or woodlands on nearly level land may need underdrains to avoid waterlogging and/or salt buildup. Municipal sewage is treated at Muskegon, Michigan, in this way at the first major U.S. regional and complete land treatment system. On gentle slopes where clay soils prohibit percolation, a 'spray runoff' overland flow technique has effectively treated food processing plant waste. Both methods require extensive land area and thus large initial capital costs, but such land might serve multiple purposes including recreation, open space, agricultural production, power plant site. Income from other uses could offset operating costs, normally lower because large chemical dosages are not required. Infiltration, the third method, uses land far more intensively, requiring only 2 to 10% of the land the others need. Treated effluent is percolated in large amounts (up to 400 ft per year) through permeable soils to recharge groundwater. Nitrate, heavy metals, and viruses need further study, but present knowledge can design successful systems. (Herr-North Carolina)

**WATER SUPPLY FROM RENOVATED WASTE WATER--A RESOURCE MANUAL FOR MASSACHUSETTS PLANNERS, PUBLIC OFFICIALS AND CITIZEN GROUPS.**
Clark Univ., Worcester, Mass.
1972. 207 p, 43 fig, 16 tab, 142 ref. Kasperson, R E and Eichen, M., eds.

Descriptors: *Water reuse, *Reclaimed water, *Water supply development, *Water treatment, *Dependable supply, Public health, Water pollution, Water costs, Consumptive use, Environmental engineering, Water resources, Impaired water use, Irrigation water, Alternative costs, *Massachusetts.
Identifiers: *Dual water supply systems, Metropolitan District Commission(Boston MA).

Metropolitan Boston, although situated in the humid northeast, is faced with the prospect of water shortages due to growing population and per capita use. This study examines one source of supply--reclaimed water--in general terms and as it might be applied to Boston. Treatment techniques are analyzed for their abilities to deal with heavy metals and toxic organic materials, and for their costs. Complete purification of waste water for all uses is expensive, lacks public support, and may pose long-term health hazards even when it meets current standards. Instead of treating waste water to make it potable, a heirarchy of water used is proposed. Higher order uses, including drinking, cooking, and bathing, require much more stringent standards than lower order uses such as irrigation or industrial application. Eighteen locations currently using renovated wastewater in municipal, industrial, recreation, or irrigation uses are listed and two in California, Santee and Lake Tahoe, are described, as well as the Windhoek, South Africa reclamation plant which supplies 1/3 of the city's water. The Metropolitan District Commission's Quabbin Reservoir in cental Massachusetts is being depleted by 12 million gallons per day. Immediate and long range plans are discussed, and a dual water supply system using reclaimed waste water for major lower order uses is proposed. (Herr-North Carolina)

**INTEGRAL CIRCULAR WASTEWATER TREATMENT PLANT,**
Union Carbide Corp., New York. (assignee)
L. M. LaClair, J. R. McWhirter, and W. L. Ross.
US Patent No 3,890,231, 12 p, 17 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 935, No 3, p 1206, June 17, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution control, Water quality control, Aeration, Equipment, *Treatment facilities.
Identifiers: Clarification.

A method of and apparatus for treating waste water by aeration with at least 50 percent oxygen in an integral circular plant is disclosed. The wastewater treatment apparatus comprises a circular tank outer wall, a circular inner wall concentric with and spaced from the outer wall forming an inner volume and an intermediate volume between the inner and outer walls such that the ratio of the inner wall radius to the outer wall radius is between 0.25 and 0.70. A first radial partition extends across the intermediate volume between and joined at opposite edges to the inner and outer walls, and a second radial partition also extends across the intermediate volume between

joined at opposite edges to the inner and outer
s. First fluid mixing and recirculation are pro-
d within the outer wall in a first part to form a
aeration zone. Second fluid mixing and recir-
lion means are provided within the outer wall
second part other than the first arcuate portion
orm a second aeration zone. Gas and liquor
ages are provided between and means for
ormly distributing oxygenated liquor around
clarifier inner wall for radial flow toward the
r wall are also provided. (Sinha-OEIS)

anami, and Y. Fukuyama.
Patent No 3,890,226, 5 p, 4 ref; Official
tte of the United States Patent Office, Vol
No 3, p 1205, June 17, 1975.

riptors: *Patents, *Waste water treatment,
ustrial wastes, *Water pollution control, Alu-
m, Precipitation, Neutralization, Acids.
ifiers: Acid wastes, Alkali wastes, Aluminum
facturing.

e waters from the aluminum surface treating
ss of aluminum manufacturing factories are
cted to a neutralization treatment in order to
n dischargeable treated waters and also to
er aluminum hydroxide sludge having a
ure content of less than 60 percent, espe-
less than 50 percent. Aluminum sludge is
ered from alkali and acid waste waters which
gh in aluminum concentration as well as from
eneral waste water (rinsing waste water)
is low in aluminum concentration. The
od treats aluminum-containing waste waters
ding acid waste water to the aluminum-con-
g alkali waste water to neutralize those waste
s. The neutralization reaction is charac-
d by adding the acid water slowly after the
num hydroxide begins to precipitate, and
nging the netralization time. (Sinha-OEIS)

**CESS FOR REMOVING HEAVY METAL
IN WATER,**
jiyama.
Patent No. 3,890,225, 5 p, 4 fig, 6 ref; Official
te of the United States Patent Office, Vol
No 3, p 1205, June 17, 1975.

iptors: *Patents, *Waste water treatment,
strial wastes, *Heavy metals, *Water pollu-
treatment, Adsorption, Filtration,
stones, Soil contamination.
fiers: Coral fossil limestones.

cess is described for preventing water and
llution. Coral fossil lime stone is used in the
g apparatus. The coral fossil consists
of limestone, abundantly occurring in
on the coral reefs of the South Sea Islands,
kinawa Islands and the Tokunoshima Island,
ground into grains of sand-like or pebble-
ze. This coral fossil is mineralogically com-
of calcite containing a certain amount of
nite and has a different mineral composition
hat of the lime stone of compact structure,
ing in Japan proper. The coral fossil is
d of the remains of coral, Foraminifera, lime
Mollusca, etc. of the Quaternary period of
ic time, and is extremely porous. Industrial
sewage, sludge deposits or soil polluted
eavy metals is poured into the filtering ap-
s directly or with water to adsorb and
e the heavy metal ions such as Cu, Cd, Hg,
n, etc. The treating material that has ad-
heavy metal ions may be heated to convert
tals into their oxides, or may be treated with
acid to liberate and recover the heavy
. The regenerated adsorbing materials can
sed for the removal of heavy metal ions.

**AIR AND WATER POLLUTION CONTROL,**
El Paso Southern Co., Tex. (assignee)
W. H. Chapman, and J. F. Eichelmann, Jr.
U.S. Patent No. 3,890,207, 6 p, 1 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 935, No 3, p 1200-1201, June 17, 1975.

Descriptors: *Patents, *Gases, *Air pollution, *Industrial wastes, *Waste water treatment, *Separation techniques, *Water quality control, Water pollution treatment, Distillation, Evaporation.
Identifiers: Water scrubbers, Wet dust collectors.

A process is described for the purification of industrial effluent gases by means of water scrubbers, wet dust collectors and the like. The scrubber water, rather than being discarded and thereby creating another pollution problem, is itself purified and reused for industrial and domestic purposes. The suspended contaminants in the water effluent are separated and the resultant water effluent is freed of dissolved noxious gases and fumes and is substantially distilled to give a pure water condensate and a concentrated effluent containing dissolved solids. The concentrated water effluent is mixed with a circulating, relatively non-volatile carrier liquid, the water is evaporated and recovered as an industrial water condensate, and the precipitated solids are removed from the carrier liquid. **CLOSED RECYCLING SYSTEM FOR WATER PURIFICATION AND WASTE REDUCTION,**
D. W. Stout.
U.S. Patent No. 3,892,662, 6 p, 3 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 936, No 1, p 225, July 1, 1975.

Descriptors: *Patents, Water purification, *Waste water treatment, Water quality control, Water pollution control, *Separation techniques, *Freezing, *Centrifugation, Incineration, Industrial wastes, Domestic wastes, Equipment, *Recycling.
Identifiers: Water crystals.

A waste purification and reduction, water purification and recycling process comprises collecting and storing household, commercial or industrial waste, homogenizing the waste and reducing the solid content to uniform fine particle size. The homogenized waste is injected through an atomizing nozzle. Then the atomized waste is cryogenically frozen into minute crystalline particles consisting essentially of water crystals and crystals of solid waste. The crystalline particles are homogenized and the size of the particles reduced to produce a crystalline particle mass having the flow characteristics of a liquid. The water crystals are centrifugally separated from the solid waste crystals and the water crystals are heated to steam and the steam is condensed into water for recycling for household use. The solid waste crystals are heated to combustion gas and ash which are then separated and the gas is vented and the ash is collected. (Sinha-OEIS)

**REMOVAL OF POLLUTANTS FROM WATER,**
Melbourne Univ., Parkville (Australia). (assignee)
N. G. Siviour, G. M. Pearson, and G. V. Cullen.
U.S. Patent No. 3,892,661, 5 p, 7 tab, 9 ref; Official Gazette of the United States Patent Office, Vol 936, No 1, p 225, July 1, 1975.

Descriptors: *Waste water treatment, *Patents, *Water pollution treatment, *Water purification, *Water quality control, Absorption, Lignite, Coals, Chemical Oxygen Demand.
Identifiers: Brown coal chars.

Described is the use of brown coal and especially brown coal chars as absorbents for pollutant materials, including microbial organisms and non-living pollutant substances. Brown coal will remove pollutant organisms from water with a high degree of efficiency; however brown coal itself is not particularly effective in the removal of other pollutant substances (as measured by C.O.D.). Brown coal chars will effect substantially reduction in the C.O.D. of polluted waters, without resorting to any special procedures for activation of the chars. Chars may be produced from brown coals by heating at any temperature between about 200 deg and 1200 deg C. (Sinha-OEIS)

**METHOD OF PURIFICATION OF WASTE WATER PRODUCED FROM THE PACKING OF MEAT AND AQUATIC ANIMALS,**
Zenkoku Reitogyoniku Kyokai, Hokkaido (Japan). (assignee)
M. Furuta.
U.S. Patent No. 3,892,640, 7 p, 4 fig, 3 tab, 9 ref; Official Gazette of the United States Patent Office, Vol 936, No 1, p 219, July 1, 1975.

Descriptors: *Patents, *Waste water treatment, *Water pollution control, *Water quality control, *Water purification, *Electrolysis, Biochemical oxygen demand, Chemical oxygen demand, Electrolytes, Separation techniques, Equipment.
Identifiers: Slaughter and processing waste water.

A method is disclosed of purifying the contaminated waste water that is produced in the slaughter and processing of livestock and aquatic animals and containing water-soluble colloidally dispersed materials selected from at least one of water soluble protein, visceral matter or blood. The method includes passing the waste water through the compartments of at least one electrolytic tank containing a number of compartments; each compartment is separated from the next adjacent compartment by an electrically insulated partitioning plate. Each compartment contains at least one pair of electrode plates comprising a solid metallic anode selected from iron, stainless steel or aluminum and a cathode. At least one electrolyte is added to the waste water, selected from the group consisting of the halides, halogen acid salts and nitrates of the alkali metals, alkaline earth metals and ammonium in an amount such that the concentration of the electrolyte in the waste water is 0.03 - 1.7% by weight. The waste water is agitated and waste matter adhering to the surfaces of the electrodes is removed after passing a direct-current through the electrolyte-added waste water to effect its electrolysis. (Sinha-OEIS)

Airco, Inc., Montvale, N.J. (assignee)
B. S. Kirk.
U.S. Patent No. 3,892,659, 6 p, 3 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 936, No 1, p 224, July 1, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, Water quality control, Oxygenation, *Activated sludge, *Biological treatment, *Recycling.
Identifiers: Clarification.

An improved and economical multiple-pass wastewater treatment system using the activated sludge biological process is capable of increasing the effective reactor detention time as required for effective water purification without decreasing the

correct flow velocity required for efficient mixing of the reacting liquid. A mixing vessel or well receives influent waste-water and activated sludge. The mixture is continuously withdrawn and mixed with oxygen as it goes successively through a plurality of contained reaction stages for predetermined detention and oxygenation of the mixed liquor. After detention and before clarification, the mixed liquor is divided into two streams, one of which goes to a clarifier, the other being recycled directly to the mixing vessel. The recycled stream which is subject to control for compensating significant variations in flow rate of incoming wastewater, is at least equal to the volume of the clarifier stream and may be greater, depending on the desired number of recycling passes of the mixed liquor through the detention-reaction stages. A generally continuous turbulence of the mixed liquor is induced during the reaction-detention period for optimizing the BOD reduction. Activated sludge from the clarifier is recycled to the mixing well and the clarifier effluent after disinfection is discharged for return to natural waters. (Sinha-OEIS)

**PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON WASTE OIL RECOVERY AND REUSE.**
Association of Petroleum Re-Refiners, Washington, D.C.
Held February 12-14, 1974, Washington, D.C. Published by Information Transfer Inc., Washington, D.C., 1974. 418 p.

Descriptors: *Recycling, Oil, *Oil wastes, Oil spills, *Oil pollution, *Waste treatment, Water pollution control, *Pollution abatement, Water reuse, Separation techniques, Waste water treatment, Water pollution sources, *Industrial wastes, *Waste disposal.
Identifiers: *Waste oil recovery, *Waste oil reuse.

During the three day conference papers were presented on the technical, institutional and economical aspects of spent and waste oil recovery. The attributes of reuse of waste oil as a fuel oil as well as the institutional problems and potentials by detrimental aspects were fully considered. The latest information has been reviewed on the magnitude of the problem, the sources of the problem, technical solutions, institutional problems, examples of recycle and reuse, and national, state, and municipal programs. (See also W75-10740 thru W75-10768).

**OIL REUSE--A NATIONAL NEED,**
Environmental Quality Systems, Inc., Rockville, Md.
L. W. Weinberger.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 5-7, 1974.

Descriptors: Oil, *Oil wastes, *Oil industry, Fuels, Water pollution sources, *Oil pollution, Waste disposal, Recycling, Industrial wastes.
Identifiers: *Waste oil recovery, *Waste oil reuse, Re-refining.

Oil waste is one of the few pollutional problems whose solution would meet the criteria of: improving environmental quality of water, air, and land; conserving energy; conserving resources; and, making economic sense. Waste oils can be re-refined. They are a resource which can be utilized to reduce energy and oil shortages. They are currently being disposed of in ways which cause environmental degradation. Certain practices related to oil disposal such as uncontrolled use as a fuel should be prohibited. Most oil re-refiners in business ten years ago have gone out of business. Both the Federal Water and Air Quality Acts put tighter controls on disposing of waste oils. An effective waste oil collection, treatment, and reuse system must include storage, collection, treatment, distribution and sale, licensing, monitoring and surveillance, financing and legislation, as well as roles for all segments of society to play in the development of such a system. The reason there is presently no viable oil reuse system is that no one seems to have the responsibility or is willing to assume the responsibility of putting the necessary programs together. The institutional aspects appear to be of more significance than the technical or economic aspects. (See also W75-10739) (Orr-FIRL)

**DISPOSAL OF USED CRANKCASE AND OTHER OILS IN CANADA,**
Department of the Environment, Ottawa (Ontario).
D. J. Skinner, and P. L. Strigner.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-24, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 29-41, 1974. 11 ref.

Descriptors: *Oil, *Oil wastes, Oil industry, Legislation, Governments, *Canada, *Waste disposal, Foreign research, Industrial wastes.
Identifiers: Re-refining.

The waste oil problem in Canada is discussed. The formation of the Petroleum Association for Conservation of the Canadian Environment (PACE) is described. More than 40,000,000 gallons of used crankcase oil are generated in Canada annually; when all waste oil is considered the amount may be as much as 70,000,000 gallons. A variety of storage/collection techniques are operative. Disposal of waste service station and other crankcase oils is varied--road oiling is most common, followed by re-refining, land fill, combustion as fuel and incineration. Undesirable features of the disposal methods are environmental pollution and irretrievable loss of resource. Investigations to improve some of the disposal methods are increasing. Legislation is aimed largely at controlling pollutional aspects. Governments and the petroleum industry are showing an increased interest in disposal because of antipollution pressures and also the energy shortage. Recommendations include: the creation of an active, voluntary, national body comprising representative personnel from the oil industry, oil disposal firms, and various levels of government; Statistics Canada and PACE should gather more detailed statistics on the availability of used oils with emphasis as to the types and source; and, extension of change periods for oils to prolong their use should be studied. **DISPOSAL AND/OR RECYCLE OF AIR FOR WASTE PETROLEUM OILS AND LUB CANTS,**
R. H. Kroop, and M. Lieberman.
In: Proceedings of the International Confere on Waste Oil Recovery and Reuse, February 14, 1974, Washington, D.C., Information Trans Inc., Washington, D.C., p 117-129, 1974. 4 fi tab.

Descriptors: *Oil wastes, *Recycling, *Wa disposal, *Waste treatment, *Oil pollution, Po tion abatement, Aircraft, Airports, Water po tion sources.

The disposal of Air Force waste petroleums, and lubricants (POL) is a complex and ser problem. Efforts to determine how waste P products could be more effectively disposed o recycled are discussed. Topics considered incl the generation of waste POL's at Air Force ins lations, the collection and segregation of wastes, disposal and recycle alternatives, and reprocessing of synthetic turbine lubricants. N

ıe several disposal and recycle alternatives
ıable is universally applicable. A highly desira-
olution at one installation may not be feasible
ınother installation even though both installa-
may generate the same types and volumes of
e POL's. Contractor pickup for ultimate
ɔsal or recycle involves the least effort for
personnel, but provides only a low, if any,
etary return. On-base disposal by fuel
ıgrading on combustion in existing boilers in-
es extra handling but can be widely applied
contributes to solving both environmental
lems and energy shortages. The reprocessing
recycle of synthetic turbine lubricants shows
ite potential and must be evaluated from the
points of product reliability and economics.

sal, Facilities, Ships, Fuels, Oil, Pollution
ment, Water pollution sources, Treatment
ies.
ifiers: Waste oil management.

utline is given of the Navy's oily wastes han-
and disposal program. The program has two
goals: to prevent the generation of these
es; and, to use a total system approach at
complexes to provide maximum utilization
existing, modified, and new
sal/reclamation facilities. In the fiscal year
the Navy used more than 90 million barrels
el oil and related petroleum products. Due to
ature of the total oil management system and
ation requirements within the Navy, a variety
wastes are produced, both ashore and afloat.
neasures being taken to prevent oil spills and
duce the volumes of oily wastes to be
sed of will have a significant effect on the
rements for waste oil treatment and disposal
ies. The facilities will require a total system
ept including collection, transportation,
ge and treatment/disposal. Corrective action
astes from naval ships includes: installation
pe risers from bilge pumps to deck connec-
on the main deck to offload oily wastes; in-
es in waste oil holding tank capacities; instal-
of reliable tank level indicators; modifica-
of aviation fuel reclamation systems; and,
tion of the volume of bilge wastes. In fiscal
1974, a military construction program was
rized which includes the improvement of the
llection and reclamation facilities at Norfolk,
onville, and Oakland. The ship to shore
fer of oily wastes is being improved through
nstruction of 17 donuts of the closed bottom
ept and the design of an oil/water separator
n to provide clean-out services for the
s. (See also W75-10739) (Orr-FIRL)

B. R. Williams.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 239-243, 1974.

Descriptors: *Oil wastes, *Oil, *Recycling, *Oil industry, Natural resources, Conservation, Resources development, Pollution abatement, Water pollution sources, Industrial wastes.
Identifiers: *Re-refining, Re-refining industry.

The feasibility and desirability of producing reusable products from waste oil is discussed. A review of the re-refining industry and a profile of the capabilities and benefits of re-refining are presented. The preservation of reusable waste oil to recover the most valuable elements as well as re-refining as a contributor to the solution of the energy shortage are also discussed. The production of reusable products from waste oil is feasible because of the seemingly perpetual characteristics of petroleum oil and it is desirable from the standpoints of both the conservation of irreplaceable natural resources and the abatement of pollution potential. **POLLUTION CONTROL WITH A COMPREHENSIVE WASTE OIL PROCESSING PLANT,**
Environmental Quality Systems, Inc., Rockville, Md.
G. D. Gumtz.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 261-279, 1974. 2 fig, 9 tab.

Descriptors: *Oil wastes, *Waste treatment, *Pollution control, Facilities, Design, Maryland, Ultimate disposal, Incineration, Distillation, Filtration.
Identifiers: *Waste oil recovery/disposal plant.

The design of a plant for the reuse or disposal of waste oils generated in Maryland is discussed. For preliminary design purposes, a single processing facility was postulated which has the potential to treat all the waste oils generated on a state-wide basis. The following design needs were considered: treatment or disposal of all types of waste oils that are collected within Maryland; production of fuel oil; the total waste oil recovery and reuse system need not produce a profit; compliance with all current and projected State and Federal environmental standards; use of existing technology; and, capacity of the plant to be based upon 1975 estimates. Plant design and the specification of unit operations depend on the expected flow(s) for the process in question and the product(s) desired. The following processes were selected to be included in the preliminary design of waste oil processing facility: chemical treatment; settling; flash distillation; absorbent treatment; solvent extraction; and, filtration. Ultimate disposal of process residues and non-recoverable waste oils must be as efficient and environmentally sound as other operations of the plant. Of the six ultimate disposal methods considered, total incineration was chosen because it minimizes the environmental impact of ultimate disposal, produces a concentrated relatively pure residual, places ultimate disposal practices primarily under the control of the processing facility, increases the flexibility of the facility for comprehensive waste oil recovery/disposal, and eliminates any possible oil pollution problems due to process residues. **EXPERIENCE WITH THE IFP PROPANE CLARIFICATION PROCESS IN RE-REFINING SPENT CRANKCASE OILS,**
Institut Francais du Petrole, Paris.
D. Vu Quang, J. W. Andrews, G. Carriero, R. Schieppati, and A. Compte.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 281-287, 1974. 2 fig, 7 tab.

Descriptors: *Oil wastes, *Waste treatment, *Recycling, *Lubricants, Economics, Oil industry, Sludge, Waste disposal, Pollution abatement.
Identifiers: *Re-refining, Propane/acid/clay treatment.

A process is described which was developed by the French Petroleum Institute (IFP) for propane clarification of spent lube oils prior to conventional acid/clay treatment. The process is simple, and can easily fit into overall re-refining operations. Viscolube Italiana, an IFP licesee, has shown that the IFP process lowers the amounts of acid and clay needed, reduces sludge formation and associated pollution, and improves product quality. The yields are much higher than for conventional acid/clay treatment alone and the plant investment and operating costs are low. The process is well suited for re-refining multigrade motor oils formulated with high concentrations of pour point improvers, viscosity index improvers and other additives, and containing large amounts of varnish, gums and other asphaltic compounds. Four grade of re-refined oil are produced by Viscolube Italiana. These are compared with corresponding lube oils derived from virgin stocks. The color, acid number, and Conradson carbon are better for the propane-clarified oils. Viscolube Italiana has been able to market re-refined oils on a competitive basis with lubricants prepared from virgin stocks. Three industrial plants have been licensed by IFP (Viscolube Italiana, Magnisi Italiana, and a Yugoslavian plant) which are designed for a total of 121,000 tons/year. (See also W75-10739) (Orr-FIRL)
W75-10759

**OIL CONTAMINATED WATER RECYCLING SYSTEM,**
J. L. Overfield, and J. W. Richard.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 289-294, 1974.

Descriptors: *Oily water, *Recycling, *Waste water treatment, Equipment, Separation techniques, Oil-water interfaces, Pollution abatement.
Identifiers: Filter/coalescer unit.

Results are discussed of a program to demonstrate an oil contaminated water recycling system which will remove oil from contaminated water to ten ppm and remove solids. The system consists of a filter/coalescer, a solids cleaner, and accessories. The filter/coalescer unit is the main component and is composed of the following principal sections: filter/coalescing cartridges; a backflush system; and, automatic oil discharge system for separated oil. The filter/coalescer unit differs from other similar units in that the automatic backflush mode greatly reduces possible solids plugging of the cartridge; the backflush mode can be operated while the unit is in full service; the unit is mounted horizontally rather than vertically; and, the unit can be used on shore, on board ship or submerged. The water, oil, and solids are first sent into the filter/coalescer unit. The solids are captured in the core of the cartridges and the water and oil pass through the cartridges to the tank of the unit. The oil collects in the oil boot and the water flows out the clean water outlet. The solids are backflushed to the solids cleaner where the oil is removed. Clean water and solids are discharged and the oily water is returned to the filter/coalescer unit. Final testing of the filter/coalescer unit was performed using fresh water and crude oil, simulated sea water and crude oil, and offshore production brine water with oil and production chemicals. (See also W75-10739) (Orr-FIRL)
W75-10760

**RE-REFINED DIESEL LOCOMOTIVE LUBRICATING OIL,**
W. F. Liebenow.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 295-297, 1974.

Descriptors: *Oil wastes, *Recycling, *Waste treatment, *Railroads, Economics, Lubricants, Conservation, Pollution abatement.
Identifiers: *Re-refining, Diesel fuel, *Lube oil.

The success that the C and O Railway has had in using re-refined lube oil in their diesel locomotives is described. The C and O from 1952 to 1959, re-refined its own lube oil drainage from diesel locomotives. A batch volume distillation unit with press frame filter was used. Additives were added in mixing tanks and the oil pumped into new oil supply tanks. The oil that was produced by this process met the same specifications that were used for new oil and worked in a diesel locomotive in regular service over a long-period of time as well as new oil. No lubrication problem has ever been discovered that was caused by re-refined lube oil. Economics and an exploded plant caused the C and O to start sending their waste oil out to be re-refined in 1959. The control measures for re-refined oil should be the same as for new oil-- for both products the C and O runs tests to insure compliance with their specification. Disadvantages of re-refining include: collecting and transporting the drainage to the re-refiner and returning the finished product; the necessary close control of the collected material; and, the bias of locomotive builders against re-refined oil. Advantgaes of using re-refined oil include: a net saving over new oil of between 15 to 20 percent; the product varies less than new oil since the C and O gets back their own drainage; the re-refiner will add the additive of the C and O choice; and, re-refining conserves oil. (See also W75-10739) (Orr-FIRL)
W75-10761

**WASTE OIL--SOLUTION TO MARYLAND'S ENERGY CRISIS,**
Maryland Environmental Service, Annapolis.
J. C. Uhrmacher, and B. L. Pollack.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Incorporated, Washington, D.C., p 301-308, 1974. 1 fig, 6 ref.

Descriptors: *Oil wastes, *Oil, *Maryland, Costs, Environmental effects, State jurisdiction, Legislation, Waste disposal, Ultimate disposal.
Identifiers: Waste reuse.

The possibility of the use of reprocessed waste oil as fuel oil is considered. Technical questions regarding such an application are whether reprocessed waste oil can be burned in presently available furnaces, whether furnace maintenance would then be adversely affected, what environmental effects of burning reprocessed waste oil might be, and what short term and long term market prospects exist for waste oils as fuels. Maryland's Environmental Service is re-assessing the ban on the use of lead-bearing fuels and is at the same time working to provide a state-controlled source of alternative, lead-free fuel oil manufactured at a state-controlled facility. The facility would eventually accept all oily wastes in the state and either provide conversion or ultimate disposal of them. The Maryland Environmental Service hopes to see State legislation passed requiring all waste oils picked up in Maryland to be deposited at State-owned facilities. (See also W75-10739) (Prague-FIRL)

**MASSACHUSETTS WASTE OIL MANAGEMENT ACTIVITIES,**
Massachusetts Water Resources Commission, Boston. Div. of Water Pollution Control.
D. L. Corey.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse February 12-14, 1974, Washington, D.C., Information Transfer, Incorporated, Washington, D.C., p 309-325, 1974. 1 fig, 6 tab, 4 ref, 1 append.

Descriptors: *Waste disposal, *Oil wastes, *Legislation, *Massachusetts, Industrial wastes, Costs, Planning, Federal jurisdiction, State jurisdiction.
Identifiers: *Re-refining, *Waste management.

Waste oil disposal problems in Massachusetts are discussed. The Massachusetts Division of Water Pollution Control has the level responsibility of controlling collection and disposal of waste oil as well as carrying out management activities. The licensing of waste oil collection and disposal firms is required. The largest volume of waste oil comes from the automotive oil; other sources include hydraulic oils, cutting oils, separators in terminals, railyards, airports, and industrial facilities. Due to economic disincentives such as labelling and exise tax rulings, re-refining of lube oil is no longer practiced in New England, although limited reprocessing of selected waste from fuel oils for special markets still occurs. The research and development programs for oil production control and waste oil disposal were conducted; future planning includes a review of licensing requirements and the use of advanced technology to convert waste oil to valuable products. In addition, the Commonwealth of Massachusetts is hoping that the Federal government will act to remove legal and economic obstructions to re-refining. (See also W75-10739) (Prague-FIRL)

**WASTE AUTOMOTIVE LUBRICATING OIL AS A MUNICIPAL INCINERATOR FUEL,**
GCA Corp., Bedford, Mass. GCA Technology Div.
S. Chansky, B. McCoy, N. Surprenant, and J. Sahagian.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer Incorporated, Washington, D.C., p 327-365, 1974. 8 fig, 8 tab, 54 ref.

Descriptors: *Municipal wastes, *Oil, Costs, Environmental effects, Oil wastes, Design criteria, Incineration, Monitoring, *Waste treatment.
Identifiers: Automotive lubrication oil, Waste oil, Waste reuse.

The physical and combustion properties of automotive waste oils were demonstrated to be suitable for auxiliary fuel in a municipal incinerator. It was recommended that the effectiveness of burning waste oil be evaluated for alternative designs, locations, and number of waste oil burners necessary. Criteria for effectiveness include stack emissions levels, residue quality, and burner and incineration maintenance problems. It will then be necessary to quantify the waste oil needed in relation to refuse composition and moisture level; to demonstrate and evaluate monitoring and control systems for firing waste oil burners; to demonstrate and evaluate the waste oil storage and feed system performance; and to verify economic estimates as compared to real costs. **AN ECONOMIC MODEL OF WASTE OIL RECOVERY, REPROCESSING AND DISTRIBUTION SYSTEMS,**
Environmental Quality Systems, Inc., Rockville, Md.
E. J. Martin, and L. McMillan.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Incorporated, Washington, D.C., p 405-418, 1974. 4 fig, 4 tab.

Descriptors: *Model studies, *Mathematical models, *Costs, Waste disposal, *Maryland, Operating costs, Capital costs, Profit, *Waste water treatment, Waste treatment.
Identifiers: *Waste oil recovery, Re-refining.

A mathematical model for the economics of waste oil recovery and re-refining has been developed by the Maryland Waste Oil Recovery and Reuse Program. Called the Cost, Revenue, and Profit (CRP) Model, this model calculates the cost of recovery, re-refining and distribution of waste oils. Additionally, it calculates revenues generated by the sale of these products to determine profit or loss. Cost components include: initial investment for real estate, the re-refining plant, collection and distribution systems, and capital for project startup; annual operating cost of the system; annual cost of collection and distribution of oils; cost of insurance; the depreciation of the plant and capital equipment; and cost of operating and investment capital. The model employs interactive factors whereby alternative systems are possible, dependent upon impact. A description of not only costs but also the revenue section of the model is given. Measures such as operating profit, net profit, cash flow, and return on investment dollar indicate the economic viability of any given system. (See also W75-10739) (Prague-FIRL)

: Waste discharge, Effluent treatment, tion.

Equipment is described which emphasizes the reduction of costs of effluent treatment. With new legislation on water quality of waste discharge streams, efficient treatment is necessary as well as some recovery of waste streams. A system for separating oil from washwater was designed to suit specific effluents and the level of purity required by individual regulations. William Boulton, Ltd., packaged a system for connection to existing drains; the costs are about 40 percent less than existing systems. A small scale interceptor for lighter-than-water pollutants has been manufactured by Conder Hardware Ltd. and offers easy installation and straightforward operation. Its tanks are made of glass-reinforced plastics and PVC connecting pipes and ring seal sockets. Other systems described for effluent treatment are used for solids removal. Two new pieces of equipment are the Accelerator, from the G. F. Dickson Environmental Engineering Ltd. and the Flockation process from Neckar Water Engineering Ltd. These operate by coagulation followed by floc removal and save a great deal of time, space, and capital costs over conventional processes. Sludges produced by water treatment systems can be dewatered by a Winklepress, designed by Simon-Hartley Ltd. and Gebr. Bellmer KG. (Prague-FIRL)

**PRINCIPLES OF ESTABLISHING SEWER SYSTEMS IN THE RURAL SETTLEMENTS OF MAGDEBURG COUNTY (GRUNDLAGEN FUER DIE ABWASSER-TECHNISCHE ERSCHLIESSUNG VON LANDGEMEINDEN IM BEZIRK MAGDEBURG),**
G. Boelsch, L. Baersch, H. Winter, and S. Petzold.
Wasserwirtschaft-Wassertechnik, Vol 24, No 6, p 199-201, 1974. 1 tab.

Descriptors: *Sewerage, *Rural areas, Percolation, Pipes, Rainfall-runoff relationships, Rain water.
Identifiers: *Magdeburg County(East Germany), Retention basins, Gravity flow.

The principles of establishing sewer systems in the rural settlements of Magdeburg county, East Germany, are presented. The rural sewer systems will be designed to minimize costs and with the possibility of extensive volunteer work. The sewer systems will incorporate pipes 200 or 300 mm in diameter for gravity flow. There will be no discharge possibility from cellars and basements. An improved mixed sewer system with rainwater retention and rainwater purification basins will be adopted. These basins will be designed for a retention time of 10-20 min. (Takacs-FIRL)

**INVESTIGATIONS ON THE PRODUCTION OF HYGIENIC COMPOST FROM AIR-DRIED SEWAGE USING DIFFERENT ADDITIVES (VERSUCHE ZUR HERSTELLUNG VON HYGIENISCH EINWANDFREIEM KOMPOST AUS LUFTGETROCKNETEM FAULSCHLAMM UNTER VERWENDUNG VERSCHIEDENER ZUSAETZE),**
D. Gaul, D. Strauch, W. Scholl, W. Mueller, and K. Miersch.
Umwelthygiene, Vol 25, No 10, p 227-236, 1974. 5 tab.

Descriptors: *Water purification, *Sewage sludge, Waste disposal, Municipal wastes, Industrial wastes, Sludge drying, Bacteria, *Waste treatment.
Identifiers: Germany, Compost, Biorott.

In the purification plant at Neureut, Germany, the waste water from the Karlsruhe population of 310,000 is purified, along with waste water from 250 industrial facilities. After mechanical separation the sludge is pumped into two digestion towers where it is stored. Liquid sapropel with a water content of 98% is then pumped into earth basins where part of the water is lost through normal drainage. When the water content reaches 75%, the sludge is lifted from the basins and placed in small piles for further drying. This material undergoes drying processes lasting roughly a year and is ground and composed in clumps measuring 2.0 m x 5.0 m x 1.5 m. Various types of typhus or paratyphus bacteria are added to each clump. A substance called Biorott, made of vegetable origin and consisting 80% of various proteins, was tested for its ability to produce pathogen-free compost of dried sewage sludge; it proved to be the most effective substance tested. A pathogen-free compost could only be produced during the warm season between April and October, and additives were necessary for this production. (Nave-FIRL)

**WATER QUALITY FACTORS IN DESIGNING A SEWAGE PLANT BASED ON PUBLIC DRAINAGE STATISTICAL DATA, (IN JAPANESE),**
S. Ebina.
Gesuido Kyokai-shi, (Journal of Japan Sewage Works Association), Vol 12, No 129, p 36, February 1975. 9 tab, 8 ref.

Descriptors: *Waste water treatment, *Water quality control, Sewage, *Design criteria, *Treatment facilities, Suspended solids, Biochemical oxygen demand, Drainage, Data analysis.
Identifiers: Sewage plants, Sludge volume index.

Data on sewage water quality collected from over 200 sewage plants were treated statistically to design guidelines for future plant constructions. The average rate of waste water discharge per person in 1970 was 500 liter/day reaching to the average capacity of sewage plants of 700 liter/day person. The BOD value in untreated sewage water was almost the same in 1969 and 1970 (134 mg/liter and 125 mg/liter respectively); however, the suspended solids in corresponding years were 197 mg/liter and 175 mg/liter. The average contributions of BOD and SS to the sewage water in 1970 were 44 g/day person and 40 g/day person respectively. The stability of water treatment efficiency is related to the capacity of tanks used for treating sludge, such as conventional and step-aeration tanks. The sludge volume index value in 1970 ranged between 50 to 150. Therefore, future plants must have the tank capacity to provide for a sludge volume index of 300. The digestion tanks in the future plants are estimated to provide for 50 to 60 percent conversion efficiency of organic materials in untreated sludges. (Katayama-FIRL)

**RATE OF PHOSPHORUS UPTAKE BY ACTIVATED SLUDGE,**
San Antonio Municipal Wastewater Treatment Plant, Tex.
W. N. Wells.
Water and Sewage Works, Vol 122, No 1, p 36-39, January, 1975. 10 fig, 9 ref.

Descriptors: Phosphorus, *Waste water treatment, *Recycling, Nutrient removal, Laboratory investigations, Activated sludge, Sewage treatment, Texas, Absorption.
Identifiers: *Phosphorus uptake rate, *Phosphorus removal, Waste activated sludge, San Antonio(Tex).

A method of recycle of phosphorus from waste water is described, utilizing waste activated sludge as the stream for phosphorus removal. The rate at which phosphorus is taken up by an activated sludge appears to be an important characteristic in phosphorus removal. Determination of the uptake rate has been standardized in the laboratory whereby: a sample of sludge is mixed with primary effluent and aerated; samples are drawn at intervals and filtered through qualitative filter paper;

the filtrate is analyzed for orthophosphate; a curve of phosphorus remaining in the filtrate versus time is plotted; and the steepest portion of the curve is taken to be uptake rate in mg/liter/hr. Two criteria for effective phosphorus removal are considered. These are that enough solids be produced and that phosphorus can be incorporated into the sludge. Experiments to condition activated sludge to increase its amount of phosphorus uptake are discussed, particularly those from a San Antonio, Texas, sewage treatment plant. (Prague-FIRL)

**TREATMENT OF SERVICE WATER WITH OZONE,**
N. Tabata, and M. Mori.
Mitsubishi Denki-Giho, Vol 48, No 5, p 639-645, May, 1974. 17 fig, 6 ref.

Descriptors: *Ozone, *Activated carbon, *Waste water treatment, Chemical treatment.
Identifiers: *Service water, *Deodorisation, *Japan.

Ozone treatment of service water is being practiced in European countries. In Japan, it is being studied as a method to deodorise service water. Ozone treatment presents several technical problems which require further investigation because of the differences in conditions of Japanese and European service water. The first question asked was whether ozone treatment or activated carbon treatment is superior in its deodorising effect. Reports on the study of this question show that the ozone treatment is more effective than activated carbon. Many problems of treatment technique such as the nitric acid radical, residual ozone in water, and ozone decomposition of exhaust gas are discussed. The performance of a contact tank of gas and liquid which is the most important part of a study of treatment devices is also discussed. (Orr-FIRL)

**THE CONSEQUENCES OF ACCEPTING INDUSTRIAL WASTES INTO SEWERS; WATER POLLUTION RESEARCH AT STEVENAGE,**
Water Pollution Research Lab., Stevenage (England).
J. Borne.
Chemistry and Industry, No 1, p 1, 13-17, January 4, 1975. 2 fig, 1 tab, 5 ref.

Descriptors: *Legislation, *Waste disposal, *Industrial wastes, Sewers, Laboratory tests, Pretreatment, Water quality, Sewage, Organic matter, *Waste water treatment.
Identifiers: Great Britain, Physico-chemical treatment.

Possible legislation governing the discharge of effluents from various industries into municipal sewers was discussed. One aspect of this work was a series of laboratory investigations conducted by the Water Research Centre at Stevenage. In compliance with legislation, a form of Consent is necessary for any industry to discharge into sewer waters. The Consent specifically restricts materials such as petroleum spirit and organic solvents, as well as controlling temperature, flow rate, and pH. Difficulties and high costs associated with accepting such trade effluents are related to three aspects of sewage treatment--anaerobic sludge digestion and dewatering of sewage sludge, biological oxidation, and disposal of the treated effluent. The Laboratory has the biodegradability of constituents of industrial waste waters in admixture with sewage, using batch tests in several proportions. They also investigated the possible effects of inhibitory chemicals on the process of nitrification. Techniques are discussed for physio-chemical partial pre-treatment methods, so as to reduce the strength of industrial wastes before their discharge to a local authority sewer. Evaluations have also been made of disposal of the treated effluent in the framework of water reuse and stricter water quality requirements for sewage effluents. (Prague-FIRL)

**THE TOXICITY OF HEAVY METAL IONS TO ANAEROBIC DIGESTION,**
Water Pollution Research Lab., Stevenage (England).
F. E. Mosey, and D. A. Hughes.
Water Pollution Control, Vol 74, No 1, p 18-39, 1975. 16 fig, 2 tab, 10 ref.

Descriptors: *Toxicity, *Heavy metals, *Anaerobic digestion, *Sewage treatment, Sludge, Sulfides, *Pollutant identification, Analytical techniques, Ions, *Waste water treatment, Enzymes.
Identifiers: Heavy metal ions.

Certain heavy metal ions can inactivate enzymes by reacting with their sulphydryl groups, thus inhibiting the growth of organisms. It was implied that a relationship exists between the concentration of sulfide ions and the degree of inhibition by metals. This degree of inhibition must be ascertained for the control of anaerobic digesters. Sludge from detergent-free sewage was examined. Digesters were each charged with 2 liters of actively digesting sludge from a breeder digester and operated; solutions of various metal salts were each added 19 days later. Feed to each digester was 80 ml of raw sludge plus the required volume of salt solution; the mixtures were then stirred and let stand for an hour. Rate of feeding corresponding to a mean period of detection of sludge in the digester of 20 days. Raw and digested sludges were analyzed and volume of gases produced daily and per unit of volatile matter destroyed by digestion recorded. The silver/silver sulfide electrode was a reliable analytical tool to measure sulfide ion concentration(ps) values. A pS value over 14.0 in a digesting sludge indicated the presence of inhibitory concentrations of the heavy metal ions Zn++, Cd++, Fe++, Cu++, or Cu++, when oxidizing agents were absent. Neutralization of zinc toxicity by precipitation of zinc as zinc carbonate requires a pH value of about 7.6. Ferric ions are reduced to ferrous ions and cupric ions to cuprous ions during anaerobic digestion. (Prague-FIRL)

J. Stanek.
Textil, Vol 30, No 1, p 17-18, 1975.

Descriptors: *Water treatment, *Flocculation, *Pre-treatment(Water), Water purification, Textiles, Separation techniques, Filtration, Zeta potential, Suspended solids, Organic compounds, Filters, Sands, Particle size, Industrial water, Surface waters, Waste water treatment.
Identifiers: Sand filters, Textile industry, Nalco 600 flocculant.

The mechanism of water contact filtration includes formation of a positively charged layer of polycoagulant on the filter sand particles. Negatively charged suspended and colloid particles in water passing through the sand layer are then held on the sand particle surfaces due to electrokinetic forces. Laboratory-scale tests with contact filtration were carried out using two sizes of sand particles in the filter model. With regard to the removal of undissolved solids from raw surface water, the Nalco 600 polyflocculant gave the best results. (Trubacek-IPC)

Identifiers: Sugars, Spent sulfite liquor, Lignosulfonates.

Reverse osmosis is the term used for the process of filtering solute molecules or particles of the same order of magnitude as those of the solvent (normally water), while ultrafiltration refers to filtering of solute molecules at least 1-2 orders of magnitude larger than the solvent molecules. The fundamentals of membranes processes are explained with the aid of diagrams, and it is pointed out that one of the major problems facing users of a reverse osmosis process is the limited life of the membrane elements. An improved membrane design called the sand matrix module has been developed by Westinghouse Electric Corp. to overcome many weaknesses of the older type of membranes. The results of experimental studies are presented and discussed, showing that membrane processes are feasible for purifying the caustic extraction stage effluent from a bleached kraft mill and for recovering sugars and lignosulfonates from spent sulfite liquor. For industrial usage, membrane modules must have a minimum life expectancy of 12 months, and preferably 3 years. Experimental work at The Institute of Paper Chemistry has indicated that the newer type membrane modules may be close to reaching the life expectancies and throughput rates required for continuous commercial operations. **REMOVAL OF TRACE METALS DURING CONVENTIONAL WATER TREATMENT,**
G. M. Zemansky.
Journal of the American Water Works Association, Vol 66, No 10, p 606-609, October 1974. 5 fig, 3 tab, 16 ref.

Descriptors: *Trace elements, *Water treatment, *Heavy metals, *Water pollution treatment, Water pollution, Toxins, Cadmium, Chromium, Copper, Iron, Lead, Manganese, Molybdenum, Nickel, Zinc, Pollutant identification.

Twelve water-treatment plants were sampled. Treatment plant performance was evaluated on its ability to remove a given trace metal. Percentage removals were also calculated for individual components, such as clarifiers and filters. Analyses by both x-ray emission and atomic-absorption spectrophotometer (AA) wet chemistry were performed, so the methods could be compared. Chromium appeared to be slightly removed by microstrainers and clarifiers but generally not removed by filters. Cu was slightly removed by microstrainers and removed increasingly well by clarifiers and filters. For both iron and manganese, relatively high percentage removals in the clarifier were followed by higher percentage removal in the filters. Consistently low percentage removals of Molybdenum were obtained with all components and the plant as a whole. For nickel, only a limited number of data points were obtained and these indicated negligible removal by microstrainers and moderate removal by clarifiers and filters. The zinc percentage removal data were scattered. Detectable concentrations of cadmium and silver were not observed in the source waters analyzed. (Pulliam-Vanderbilt)

**TREATMENT PROCESSES FOR COPING WITH VARIATION IN RAW-WATER QUALITY,**
National Environmental Research Center, Cincinnati, Ohio. Water Supply Research Lab.
J. M. Symons, and G. G. Robeck.
Journal of the American Water Works Association, Vol 67, No 3, p 142-145, March, 1975. 1 tab, 36 ref.

Descriptors: *Water purification, *Demineralization, *Water quality control, *Water treatment, Aeration, Desilting, Chlorination, Disinfection, Flocculation, Desalination processes, Filtration, Electrodialysis, Reverse osmosis, Oxidation, Water softening, Nutrient removal, Waste water treatment.

Available treatment techniques for removing about 20 different raw water contaminants to meet drinking water standards are presented to help plant designers and operators understand the problems. Treatment feasibility rather than cost is considered. Some common time-varying problems, such as turbidity, discoloration, and hardness can best be dealt with through close monitoring of raw water with frequent jar tests. Good operations records show how much of which treatment produces good quality finished water from a given condition of raw water. Other problems such as odor are best dealt with by continual use of activated carbon beds. Chlorine disinfection requires close monitoring of organic matter, ammonia, and reducing substances so that the dosage will provide a target chlorination residual. Raw water contaminants particular to a specific location are a plant design problem. Turbidity removal by recently improved mixing, flocculation, settling, and sand filtration methods is discussed. Adsorption and oxidation variations for removal of organics are presented. Inorganics, such as calcium hardness, iron, manganese, nitrates, mercury, hydrogen sulfide, and 5 geochemical contaminants are examined. Reverse osmosis and electrodialysis are suggested for removal of sulfates, chlorides, and sodium which have soluble salts and are therefore not susceptible to precipitive techniques. J. T. O'Connor, L. Hash, and A. B. Edwards.
Journal of the American Water Works Association, Vol 67, No 3, p 113-116, March 1975. 4 fig, 4 tab.

Descriptors: *Distribution systems, Water supply development,*Water quality control, *Deterioration, *Corrosion, *Bacteria, *Water treatment, *Microorganisms, Decomposing organic matter, Deaeration, Nutrient removal, Aquatic bacteria, Yeasts, Water purification, Chlorination, Carbon filters, *South Dakota, Water pollution sources.
Identifiers: *Sioux Falls(SD).

The Sioux Falls, South Dakota, water-supply system was thoroughly examined to determine the role of bacteria in water quality deterioration. The water in Sioux Falls is treated for softening and iron and manganese removal. It is chlorinated. flouridated, and treated with glassy zinc phosphates. Sampling shows that after distribution it has a higher iron content indicating corrosion of cast-iron mains. The chlorine residual which starts at approximately 1 mg/l and dissolved oxygen both diminish with distance from the plant. Samples from main flushing were analyzed. Over 30 microorganism types were found, indicating a stable population that cannot easily be eradicated. Through bioflocculation bacterial growths can accumulate a biological slime in pipes containing iron particles, calcium carbonate, and other debris. During high flow these accumulations are dislodged and go into suspension. Bacterial wastes and decomposition produce off-tastes. Bacteria can reduce sulfates to hydrogen sulfide and also produce methane which destroy chlorine residuals and ruin water quality. Corrosion can be accelerated by CO2 generation. Chlorination, especially with lowered pH, can inhibit bacteria but rechlorination may be needed in the system. Removal during treatment of substances which promote bacterial growth, particularly organic carbon (measured as COD) may be most effective. Main flushing is the other alternative. **THE ECONOMIC IMPACT OF MERCURY POLLUTION ON FISHERIES AND OTHER RELATED BUSINESSES AROUND PICKWICK LAKE,**
Auburn Univ., Alabama. Dept. of Economics.
J. W. Granade, and D. R. Street.
School of Business Research Series 4, November 1973, p 8-41, 6 fig, 21 tab, 2 ref.

Descriptors: *Economic impact, *Commercial fishing, *Water pollution effects, Mercury, Income analysis, Recreation.
Identifiers: *Opportunity cost, Recreation industry, Pickwick Lake(Ala).

A ban on commercial fishing in Pickwick Lake, Alabama was imposed as a result of the discovery by the FDA of mercury concentrations exceeding prescribed limits. The economic effects of the mercury pollution and the subsequent fishing ban on the income of commercial fishermen and recreation related businesses are assessed. Holders of commercial fishing licenses who fished for added income were surveyed to determine these effects. Each fisherman was asked to estimate the proportion of his total income derived from fishing and his net income per month before and after the ban. A loss of total fishing income occurred in Pickwick Lake and in the adjacent Wilson and Wheeler Lakes. An analysis to determine the opportunity cost of the pollution indicated that total income increased for two fishermen, remained the same for five and decreased for fifteen as a result of post-ban alternative employment oppportunities. The effects on recreation related businesses were determined for the communities of Waterloo, Florence, Cherokee and Tuscumbia by comparing retail sales figures for the six months prior to the ban to those for the six months after the ban. No sizeable decline in sales was observed in any of the four communities. (See also W75-10354) (Becker-Wisconsin)

Pollution abatement need not necessarily des the international competivity of the dome economy that wishes to protect its environ The question of whether businessmen who c pete in international markets and whose cost production are increased by pollution control should be protected from competition from po ing, lower cost producers is discussed. The d tility caused by pollution must be covered by price paid by the consumers if social equilibri to be attained. The assumption is made that impossible to compare the utility gain of those whould benefit by the removal of the extern with the utility loss of those who must pay hi prices. If the employment of the best techn method of production to remove the extern (pollution) is forced, economically penalized f must be aided if they are to remain competitiv ternationally. Pros and cons of tariffs and adju ble exchange rates between countries presented. If transboundary spillovers do exist, fluctuating exchange rates will restore s equilibria without the administrative and eq problems of a tariff. The existence of transb dary spillovers necessitates the imposition tariff whose success is curtailing the spillover pends on all countries acting in concert against polluting country. IL ENGINEERING LABORATORY VELOPS UNIVERSAL CONNECTOR FOR BOOMS.
Technology, Vol 16, No 1, p 16, January 1975.

criptors: *Oil spills, *Water pollution control, pment, Design criteria, California, Oceans, ollution, *Pollution abatement.
tifiers: *Oil booms, *Universal connectors.

ntial factors in containing an oil spill are d and efficiency in completing the operation. is often inhibited by the time required to con-most commercial oil booms with the variable interconnecting devices. The Civil Engineer-Laboratory (CEL), Naval Construction Bat-n Center at Port Hueneme, California, has loped a universal boom connector. This piece quipment allows sections of different types sizes to be connected quickly. The CEL n has been accepted by the Navy as a connec-or all new booms; presently 200 commercial s are making these booms. The CEL design ists of extruded aluminum male and female ectors configured for simple attachment to nds of already available boom sections. The ooms can be connected in one minute by two working from a boat, even in rough seas, use the connectors do not have to be aligned. connector is then attached to the boom by and a metal plate; the connector is held up to oom under tensile loads by a rod running the eight of the boom. E DRINKING WATER HAS BECOME A ERAL CASE.
nical Week, Vol 115, No 22, p 46, 51, mber 1974.

riptors: *Public health, *Potable water, dards, *Legislation, Water supply, Water nent, Water purification, Chlorine, Ozone, ical industry, Oil industry, *Water quality ards.
ifiers: *Safe Drinking Water Act, Car-ens, Hydrogen peroxide.

The discovery of alleged carcinogens in drinking water from the Mississippi River is accelerating the demand for federal drinking water standards. The Safe Drinking Water Act of 1974 was passed by the Senate late last year; the House has recently enacted their version. The bills do not specify drinking water standards or methods of treatment. Instead they require the EPA to propose standards within 90 days of enactment, and make the standards final within another 90 days. The House version of the bill requires the EPA, with the assistance of the National Academy of Sciences, to determine maximum contaminant levels as well as the contaminants which may have an adverse effect on the health of humans. Federal drinking water standards could be a mixed blessing for the chemical industry--sales of water treatment chemicals would be boosted but new restrictions on plant effluents and on use of some chemicals might also result. The oil industry is objecting to the bill as it would prohibit underground water injection which is currently used to help extract oil from depleted wells. Disinfection by chlorination is also under investigation. It is thought that some of the byproducts of chlorination might possibly be carcinogenic. Ozone and hydrogen peroxide can be used as substitutes for chlorine. Ozone has been used to eliminate phenols from Whiting, Indiana, water for almost 20 years. Costs of meeting new water quality standards, that will result if the new bill becomes a law, will be high, perhaps a doubling or tripling of existing costs. (Orr-FIRL)

**EPA'S EFFLUENT GUIDELINES HAVE THEIR DAY IN COURT.**
Chemical Week, Vol 115, No 18, p 33-34, October 30, 1974.

Descriptors: *Legislation, Federal jurisdiction, Water Pollution Control Act Amendments, Industrial wastes, Effluents, Chemicals, Environmental effects, *Water pollution control, *Water quality standards.
Identifiers: Chemical process industry, *Effluent guidelines.

Out of 30 guidelines issued by the EPA under its interpretation of the Water Pollution Control Act Amendments, 21 have been challenged in court. The major challengers are the chemical process industries, who disagree with the legal interpretations of 'best practical' (for 1977) and 'best available' (for 1983) pollution controls. Inorganic chemicals guidelines have already been challenged in court and other petitions for future review include those against guidelines for organic chemicals, soaps, detergents, phosphates, plastics and synthetics, rubber, nonferrous metals, petroleum refining, fertilizers, pulp and paper, and textiles. Three main arguments have been set forth: although Congress intended guidelines for use by states and regional EPA offices in setting effluent limits for individual permits, the guidelines for existing plants have been treated by EPA as mandatory national standards; EPA did not follow the 1972 Act amendments in carrying out cost-benefit analyses to determine whether the proposed additional cleanup costs bring sufficient return in environmental improvement; and EPA based its pollution control guidelines on a few exemplary plant operations, not considering problems of older plant performance, or of climatic and regional differences. Discharge permits for industrial plants were to have all been issued by December 31, 1974. It was expected that less than two-thirds of these will have been issued by the deadline. Legal maneuvering is expected to continue, due to the ambiguities of the Act. (Prague-FIRL)

**P. L. 92-500 (TWO YEARS LATER) IS NOT THE ANSWER,**
C. W. Heckroth.
Water and Wastes Engineering, Vol 11, No 12, p 34-40, December, 1974.

Descriptors: *Federal Water Pollution Control Act, Waste water, Industrial water, Federal jurisdiction, State jurisdiction, Water pollution control, Costs, Legislation, *Water quality standards, Industrial wastes.
Identifiers: Effluent guidelines, *P. L. 92-500.

P. L. 92-500 (the Federal Water Pollution Control Act) industrial cost recovery provisions have been called discriminatory against industry unless residential and commercial connectors also are required to return their share of federal grants for facilities construction. At the annual meeting of the Water Pollution Control Federation in Denver, both P. L. 92-500 and the EPA position were criticized for the ambiguity of zero discharge provisions, the substantial demands imposed upon the States, the missed or unrealistic deadlines, the uncooridinated planning requirements, almost total federal control of the programs, paperwork in huge proportions, and the lack of practical experience of water pollution control of a large number of personnel at the Washington EPA level. Recommendations supported by State water pollution control administrators included: EPA regulations and guidelines be simplified; more responsibility be given to states and regions; planning requirements be made realistic; State Program Grants be restructured so that funds are provided to States to develop their own individual programs; and a simple program for monitoring progress be devised. (Prague-FIRL)

**FEASIBILITY TEST PROGRAM OF APPLICATION OF COALESCING PHASE OIL/WATER SEPARATORS TO SELF COMPENSATING FUEL TANKS IN SURFACE SHIPS,**
General Electric Co., Philadelphia, Pa. Re-entry and Environmental Systems Div.
J. B. Arnaiz, and E. Batutis.
Available from the National Technical Information Service, Springfield, Va. 22161, as AD-784 105, $7.25 in paper copy, $2.25 in microfiche. Coast Guard Report CG-D-88-74, May, 1974. 90 p, 17 fig, 7 tab, 6 ref. DOT-CG-24,290A.

Descriptors: *Oily water, *Separation techniques, *Water pollution control, *Oil-water interfaces, Oil wastes, Oil pollution, Fuels, Feasibility studies, Pollution abatement.
Identifiers: Coalescing plates, *Oil/water separators.

An evaluation was performed of the General Electric Coalescing Plate Oil/Water Separator concept as applied to ballast water discharged from a ship that has self compensating fuel tanks. Flow rates of up to 1200 gallons per minute were processed. At all times, the amount of oil discharged in the effluent of the separator was 5 ppm or less. The influent oil values to the separator were as high as 800 ppm and at the end of the test the influent to the separator contained almost 100 percent oil. A commercially available General Electric OPC-100 oil/water separator was chosen for the tests because it has a cross sectional area and volume very close to the equivalent of a DE-1040 forward fuel tank. On-line measurements of entrained particle size and number were obtained for both the influent and effluent; on-line turbidity was measured for the effluent only. The data from these measurements substantiated those obtained by chemical analysis. This test program demonstrated the technical feasibility of the proposed self compensating fuel tank coalescing plate oil/water separator concept for reducing the water pollution during fueling operations. Fuel which was previously discharged with the ballast water can now be retained in the ship's fuel tank and used. (Orr-FIRL)

**GUIDELINES FOR LANDFILL OF TOXIC INDUSTRIAL SLUDGES,**
New York State Dept. of Environmental Conservation, Albany. Div. of Pure Waters.

N. A. Curry.
Presented at Twenty-eighth Industrial Waste Conference, May 1-3, 1973 Purdue University, W. Lafayette, Indiana, 25 p, 2 graph, 1 append.

Descriptors: *Landfills, *Solid wastes, *Sludge wastes, *Sludge disposal, *Industrial wastes, *Water pollution control, Public health, Toxicity, Sludge, Pollutants, Waste disposal.

Guidelines were given for the use of toxic industrial sludges in landfills. These are intended for use only where reclaiming is not practical and disposition to a landfill is the best remaining method available. The following requirements for adequate landfilling are suggested: (1) detailed knowledge of the sludges, (2) precautions to insure continued insolubility of pollutants, (3) maintenance of surveillance to check efficacy of handling, (4) treatment of leachate if contaminated. Since various sludges become soluble under different and sometimes conflicting conditions, no one universal procedure will suffice. Guidelines for landfilling of toxic industrial sludges require information on composition, conditions for removal to meet non-toxic limits refusal of unacceptable wastes, pretreatment of some wastes, precautions to be taken to maintain insolubility, segregation into safely mixed classes, protection aganist water infiltration, surveillance of results and treatment of leachate if toxic. **THE LAWS AND THEIR ENFORCEMENT; PROGRESS AMIDST PROBLEMS,**
L. J. White.
Chemical Engineering, Vol 81, No 22, p 7-10, October 21, 1974. 3 tab.

Descriptors: *Federal Water Pollution Control Act, Water pollution control, Effluents, Industrial wastes, Legislation, *Water quality standards, Chemical wastes
Identifiers: Chemical process industries, Effluent guidelines

Guidelines set under the 1972 Federal Water Pollution Control Act have been challenged by the chemical industries on three grounds: procedural challenges (that is, which court has jurisdiction); claims of factual mistakes; and arguments against the Environmental Protection Agency's interpretation of the Act. For example, a controversy in interpretation is the use of 'guidelines' and 'limitations'. One viewpoint is that Congress intended the EPA to use general guidelines for effluents to define a range of discharge levels. These figures would then be used to write NPDS permits, which would give limitations for each individual situation. The EPA, however, uses limitations as standards or requirements for a particular industry. Guidelines were issued in 1974 for thirty industries; a standard or regulation, once issued, must be challenged within 90 days or be accepted. The industries, listed in the order for which guidelines were made in 1974 are: fiberglass insulation, beet sugar, feedlots, glass, cement, phosphates, rubber, ferroalloys, asbestos, meat products, inorganic chemicals, cane sugar refining, grain mills, fruits and vegetables, electroplating, plastics and synthetics, nonferrous metals, fertilizers, leather tanning, soaps and detergents, timber products, organic chemicals, petroleum refining, builders paper, dairy, pulp and paper, seafood, iron and steel, textiles, and stream and electric. **PROGRAM FOR CONTROL OF DISCHARGES OF POLLUTANTS TO NAVIGABLE WATERS.**
Federal Register, Vol 39, No 244, p 43759, December 18, 1974.

Descriptors: *Waste discharge, *Federal jurisdiction, *State jurisdiction, *Hawaii, Federal Water Pollution Control Act, Administration, Navigable waters, Permits, *Water quality standards, Water pollution control, Pollution abatement.
Identifiers: Pollutant discharge.

The United States Environmental Protection Agency has granted the State of Hawaii's request for approval of its program for controlling discharges of pollutants to navigable waters in accordance with the National Pollutant Discharge Elimination System (NPDES). This is in accord with section 402(b) of the Federal Water Pollution Control Act, as amended, and provides that a state may administer its own permit program for discharges into navigable waters within its jurisdiction after approval of such a program by a Federal Administrator. On August 30, 1974, Hawaii submitted a program for carrying out the NPDES. On October 10, 1974, EPA conducted a public hearing on the proposed approval of Honolulu, Hawaii. As of November 29, 1974, the Hawaii NPDES permit program was approved, to be administered by the Hawaii State Department of Health. (Prague-FIRL)

**JETTISONING OF LNG AT SEA--AN U RESOLVED POLLLUTION HAZARD.**
Marine Week, Vol 2, No 5, p 23, January 31, 197

Descriptors: *Oil spills, Waste disposal, *Wat pollution control, Liquid wastes, Gases, Jetsa Pollutant abatement.
Identifiers: *Liquified natural gas(LNG Shipping, Vaporization.

Liquefied natural gas (LNG) may be spilled or j tisoned onto the ocean as a result of collisi damage or if there is a need to lighten a LNG ca er, such as a disabled vessel. Another possi source of leakage is if liquefied natural gas is lowed to contact the structural steel of a hull d ing loading, the cryogenic temperature might le to an eventual brittle fracture. Tests on LNG sp lage have been conducted by the Bureau of Min the U.S. Coast Guard and the American Gas A sociation. Results showed vaporization effects a indicated that the ignition point for an explosion dependent upon the ratio of propane-to-ethane discharge of 10,000 cu m would form a cloud feet deep and a mile wide in less than fift minutes. If such a cloud should drift over ot vessels, an oil terminal, or a city, while burni serious danger would exist. Another pollut hazard with LNG is the disposal of the boil-o especially when the carrier is in the harbor. Ar ments in favor of atmospheric venting of LNG sist that the methane content is below the exp sive limit and that discharge is heated and its d sity is lower than that of air. Port authorities ar that no matter how much preheating, if there is inversion over the port, gas will not rise. Si 1974, the U.S. COast Guard has prohibited L venting in port. (Prague-FIRL)

Descriptors: *Water quality standards, Aquatic life, *Lethal limit, Pollutants, Toxicity, Water pollution effects.

The application of the medium tolerance limit, the median lethal concentration, or any other test of acute toxicity is not conclusive that any pollutant concentration is safe for aquatic life. Much of the data on the toxicities of many compounds and most elements to one or another type of fish are generally available in some form, and are reported as 'threshold concentration' or 'incipient lethal levels,' both meaning 'the level of lethal agent the animals could be expected to tolerate indefinitely'. These levels, then, should be close to the 'safe' concentrations, but they are generally not recognized as such. The authoritative sources most frequently cited as justification for particular water quality standards are the Ohio River Valley Water Sanitation Commission report on Stream-Quality Criteria and Minimum Conditions, Water Quality Criteria by McKee and Wolf, and the National Technical Advisorty Commission report on Water Quality, although none of these reports were intended to be data sources for establishing water quality standards. Standards should be set that fall in the middle range of well-documented toxicity, then the levels appropriate to ensure maintenance of desired water quality should be determined by toxicological testing and the results used to reevaluate the standards previously established. **OIL AND DEBRIS REMOVAL UNIT,**
P. Condit, Jr.
US Patent No 3,891,558, 4 p, 5 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 935, No 4, p 1652, June 24, 1975.

Descriptors: *Patents, *Oil spills, *Oil pollution, Water pollution treatment, *Water pollution control, *Water quality control, *Separation techniques, Flotsam, Jetsam, Equipment, Conveyance structures, Pollution abatement.
Identifiers: Belt conveyors.

The removal of oil films and flotsam and jetsam from water is accomplished by providing an endless belt conveyor to which the oil is intended to adhere and which is characterized by a plurality of scoops that are attached to the surface of the belt for retrieving and dumping the flotsam and other debris of a solid or quasi solid nature. A particular advantage resides in an endless conveyor which may be pivotly mounted and is therefore adapted to assume multiple angular relationships in which one lower end is intended to be in contact with the water and the other upper end in adjacent relation to receptacle means. The conveyor may be positioned at varying angles so that the receptacle may be at any height above the water. A further advantage is in the provision for adjustable wiper blades intended to clean oil from the undersurface of the belt and for modified wiper blades which may clean the upper surface of the belt even though debris scoops are attached. Adjustable tensions means at one end of the conveyor frame varies the belt tension under different operating conditions. (Sinha-OEIS)

**OIL SEPARATION AND RECOVERY DEVICE,**
F. Galicia.
US Patent No 3,890,234, 4 p, 9 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 935, No 3, p 1208, June 17, 1975.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Water pollution control, Water pollution treatment, *Separation techniques, Mechanical control, Mechanical equipment, Heating, Pollution abatement.

An oil separation and recovery device is described which may be towed or otherwise propelled over, or left stationary on, the surface of a body of intersect the liquid surface causing the oil polluted water to flow into an inner chamber as the oil rises to the trough vertices. If stationary, high pressure water is used to force the oil polluted water along the troughs to the inner chamber as a vacuum is created. In either case, but particularly the latter, the contaminated water flow path is improved by utilizing depolluted discharging water to induce a surface current of oil polluted water to flow toward the troughs. Also, the utilization of a heating means keeps the oil flowing expeditiously through the troughs. (Sinha-OEIS)

**WASTE OIL MANAGEMENT--THE ENVIRONMENTAL PROTECTION AGENCY'S ROLE,**
Environmental Protection Agency, Washington, D.C.
P. B. Lederman, and K. Jakobson.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 19-27, 1974. 11 ref.

Descriptors: Oil, *Oil wastes, *Oil industry, *Water pollution sources, Waste disposal, Oil pollution, Foreign research, Recycling, Industrial wastes.
Identifiers: Re-refining, France, Germany.

The Environmental Protection Agency has been concerned with waste oil for the past three years. The concern started with reports that these oils were entering water courses. The current EPA program emphasizes resource recovery with environmental control. The two primary sources of waste oil are crankcase oil and industrial oil. Other sources include oil recovered from spills, tank cleanings, and ballast water. EPA has had a multifaceted program in waste oil management. Programs funded include waste oil management studies, development of institutional programs, and evaluation of existing technology and methodology. EPA has funded a major program to develop a non-polluting process for re-refining and recovering waste oils for use as diesel fuel and/or lubricants. A major problem is the disposal of the sludge remainders from re-refining; therefore EPA is sponsoring work to develop acceptable means of disposing the re-refining sludges. The EPA is also sponsoring programs to develop waste oil collection systems and models. The EPA has contracts to obtain data on waste oil generation, waste oil utilization, and the engineering evaluation of current waste oil re-refining processes. French and German methods of dealing with waste oils are also discussed. (See also W75-10739) (Orr-FIRL)
W75-10742

**CONTAINMENT, COLLECTION AND RECYCLING OF OILY WASTES,**
T. Dalton.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 91-97, 1974. 1 fig, 1 tab.

Descriptors: *Oily water, *Oil wastes, *Recycling, *Oil spills, *Water pollution sources, Oil pollution, Water pollution, Industrial wastes, Pollution abatement, Waste treatment.
Identifiers: Waste oil recycling.

The basic nature of the problem of containing, collecting and recycling oily wastes is reviewed. Of primary concern is the determination of an oil balance for each specific plant location. A waste oil analysis should be performed. An oil spill contingency program should be devised for those plant situations where emergency spills may occur. Spills are broadly grouped into two categories: land spills and waterborne spills. Ekoperl and Conwed Sorbers are described; these can be used for containing and absorbing spills on land. MP Boom specifications are given; this boom can be used for containing waterborne spills. The waterborne spills, after they have been contained, can be removed by appropriate skimming devices, absorbent materials, or manual skimming. All plants should have the supplies and equipment necessary for combating oil spills readily available in the same way fire equipment is available. If the collected oil is of high quality and expensive, it should be placed in a segregated system and treated either chemically or mechanically for recycling and reuse. If the oil is of poor quality and inexpensive, it can be mixed with fuel oil and removed through the combustion process. (See also W75-10739) (Orr-FIRL)

In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 99-116, 1974. 19 fig, 5 tab.

Descriptors: *Oily water, *Oil wastes, *Pollution abatement, Water pollution sources, *Airports, Oil pollution, Oil spills, Oil, Fuels, Industrial wastes, *Port Authority of New York, New York, New Jersey.

The Port Authority of NY and NJ is conducting a comprehensive program to protect and improve the environment around the airports under its jurisdiction. In 1971, Calspan Corporation of Buffalo was retained by the Port Authority as a consultant on a far-reaching program developed to provide analysis of airport discharges, recommendations for short-term control measures and proposals for long-term preventive solutions. Short-term recommendations are: increase water pollution control unit staff; intensify tenant education programs; increase inspection and surveillance; establish sanctions against deliberate and inexcusable abuse of tenant leases; establish policy of imposing established sanctions; perform oil water separator testing; segregate wash waters from other wastes in hangars; use vacuum pick up scrubbers for ramp washing; test high pressure water systems for runway cleaning; perform experiments to test surface spray disposal of cresylic acid runway washing solutions; encourage reporting of accidental spills. Long-term recommendations include: treatment of all hangar and maintenance facility wastes; centralized deicing facilities with holding tanks for used ethylene glycol-melted ice solutions; derubberizing runways; design and install tide gates at various outfalls; install belt skimmers in sumps; install chlorination systems; install upstream booms to aid in spill tracing; install upstream booming areas for spill cleanup; install French wells where leaks are detected; and, install a centralized monitoring system. **PORT RECEPTION AND TREATMENT FACILITIES FOR OILY WASTE FROM VESSELS,**
Maritime Administration, Washington, D.C.
A. S. Armstrong, and K. J. Randall.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 149-184, 1974. 2 fig, 10 tab, 12 ref.

Descriptors: *Oily water, *Waste disposal, Ships, *Oil wastes, Water pollution sources, Waste treatment, Governments, Governmental interrelations, Recycling, *Pollution abatement, Harbors, *Treatment facilities, Waste water treatment.

The scope of the oily waste problem is described in terms of quantifying the waste oil volumes which may be expected by U.S. ports. The various methods for removing oily waste from vessels and disposing of the treated water and recovered oil are described. Also discussed is the economic viability of waste oil recovery disposal operations from vessels, and the roles of the various government agencies in preparing for shoreside handling of vessel-generated oily wastes. Conclusions and recommendations are presented in regard to collection/separation entrepreneurial potential and oil processing entrepreneurial potential. The cost associated with collection, treatment, and disposal of oily waste from vessels will eventually lead to an increase in ocean steamship freight rates or required freight rate. The role of the Federal Government should be to facilitate the growth of current oily waste facility and service capabilities to meet the requirements of maritime pollution abatement. The role of state governments is interrelated with Federal grant programs. Local government roles may be investments by communities in the construction and ownership of treatment facilities which are then operated by entrepreneurs. Local governments could also be responsible for the enforcement of bans on certain kinds of waste disposal practices. (See also W75-10739) (Orr-FIRL)

**A PROGRAM FOR HANDLING EMERGENCY OIL SPILLAGES IN THE PORT OF BALTIMORE,**
Maryland Port Authority, Baltimore.
R. Wilcox.
In: Proceedings of the International Conference on Waste Oil Recovery and Reuse, February 12-14, 1974, Washington, D.C., Information Transfer, Inc., Washington, D.C., p 225-235, 1974. 8 fig.

Descriptors: *Oil spills, *Oil pollution, *Water pollution sources, *Oily water, Equipment, Oil-water interfaces, Maryland, Ships, Port authorities, Cleaning.
Identifiers: *Baltimore Harbor(Md), Baltimore(Md), Oil spill clean up.

The Maryland Port Administration has been responsible for the removal of debris and oil from the waters of Baltimore Harbor. A State law passed in 1970 gave it the additonal responsibility of developing a program which would enable the State to respond to an emergency oil spillage in the Baltimore Harbor area. The Maryland Port Administration has assembled an inventory of sophisticated equipment designed to remove oil and debris from the harbor waters with maximum efficiency and effectiveness, and has taken a primary role in encouraging and coordinating the work of governmental agencies and private industry to assist in the minimization of the incidence of spills in the Baltimore Harbor area. In 1962, the PORT SERVICE, a small tank vessel with an oil recovery system, was acquired. In the bow of the vessel is a four-roller, hydraulically powered device which separates and removes oil from the surface of water by the principle of adhesion and cohesion; the oil clinging to the surface of the rotating aluminum drums is wiped off and flows by gravity into the vessel's 3000 gallon cargo tank. The recovered oil is off-loaded via the PORT SERVICE's own cargo discharge system. The PORT RETRIEVER, purchased in 1966, is a self-propelled waterborne front end loader. This boat removes more than one million pounds of debris from the waters of Baltimore Harbor annually. By attaching a hardware cloth insert in the scoop, the PORT RETRIEVER is capable of removing the more viscous oil spills without prior application of any sorbent materials. A water-borne dump truck has also been designed to work in conjunction with the PORT RETRIEVER. (See also W75-10739) (Orr-FIRL)

Re-refining, Waste oil industry.

view is given of some of the issues an ould consider in undertaking an anal- vaste oil industry. Waste oil disposal, ollection, waste oil re-refining, and dustry analysis are considered. Two ories of waste oils are industrial and The first is easier to recover because ntration is at the place of use. Of the allons of waste oil produced annually, 100 million gallons are re-refined or 200 million gallons are used as road rned as fuel oil, and about 750 million sed of with no specific assurances of roundwater or surface water pollu- venue comparisons of production of ls as opposed to re-refining waste oils are being delineated. Federal Trade Commission and Internal Revenue Service requirements have contributed to a decline in re-refining. Decision making involves an analysis of economic implications and impacts of policy options. Such options for cost-effective and environmentally effective decisions include: paying subsidies to recover waste oil; changing current tax laws which encourage use of virgin oil over recovered oil (such as depletion allowances); or specification of federal oil waste recovery policies. **EVALUATION OF AGRICULTURAL DRAINAGE IN WATER QUALITY MANAGEMENT,**
Water Resources Engineers, Inc., Walnut Creek, Calif.
T. C. Lyons, D. P. Russell, and R. G. Fry.
In: Agricultural and Urban Considerations In Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 529-555, 1974. 2 fig, 8 tab, 18 ref.

Descriptors: *Water quality, *Agricultural runoff, *Agricultural chemicals, *Model studies, *California, Fertilizers, Nutrients, Simulation analysis, Drainage water, Wastes, Pollutants, Soils, Irrigation, Crops, Agriculture, Land use, Mathematical models.

Changing priorities and patterns of land and water uses have given rise to new drainage and groundwater quality problems; consequently, engineers and systems analysts have developed new analytical techniques in response to these time-varying problems. One of the more promising of these techniques is mathematical simulation modeling on high speed digital and hybrid computers. The development of these techniques, however, has pushed data input requirements beyond the state-of-the-art of the traditional methods of evaluating the environmental effects of agricultural practices. Water-quality constituents returned to groundwater basins from irrigated agriculture constitute one of these illusive data sets. A procedure has been developed and used on three entire river basins in California for handling and evaluating changing land use patterns, including agricultural cropping patterns and cultural practices, and for determining the quantity of water and quality constituents contained in irrigation drainage. Discussed were the systems analysis conceptual representation of changing land and water use patterns, the procedures developed for generating the necessary agricultural drainage water quality systems input data, and the data management techniques necessary to handle the time and space-varying input data system developed. Identifiers: *Lake Apopka(Fla).

The discharge from the 9000 acre organic soil vegetable farms on the north shore of Lake Apopka have contributed to the nutrification of this lake. The net nutriet load from these farms is approximately 2400 lbs/day total inorganic nitrogen-N. Water quality sampling in 1970 indicated that the total PO4 in the northern portion of the lake was, on an average, 0.12 mg/L higher than the southern shore. Similarly, there was 0.21 mg/L more total nitrogen. The continual supply of nutrients into the lake, not only from the agricultural interests but all sources, has caused the accelerated eutrophication of this lake to the extent that it is currently not beneficial for anyone's use. The pollution effects of storm water drainage were reviewed with regard to concentration and possible means to reduce the amount of pollution entering receiving waters. Present and proposed practices for reducing the pollution load into Lake Apopka were discussed. (See also W75-10769) (Sims-ISWS)

Identifiers: *Western United States.

Today's ecology movement, which is halting water development in the western states, is the key to the future destruction of our civilization. Only water development has made it possible for the

west to bloom. Without continued development, deterioration will set in. If the quality of the environment is to be preserved for many generations to follow, the total environmental system - physical, social, and economic - must be considered together as a system. The principles that must be adhered to to optimize that total environment were discussed. The salinity problems of the rivers in the western United States were emphasized, and solutions were proposed. It was concluded that technology has the solution to problems of water quality management, or can develop the solutions needed. Those solutions must involve augmentation and the export of salts to the ocean or other sink to achieve salt balance. (See also W75-10769) (Sims-ISWS)

In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 753-785, 1974. 11 tab, 28 ref, 1 append.

Descriptors: *Irrigation, *Water quality, *Drainage, *Salinity, *Rio Grande River, *Colorado River, Salts, Salt balance, Irrigation effects, Irrigation practices, Classification, Leaching, Irrigation efficiency, Mineralogy, Soils, Rivers, Agriculture, Downstream.
Identifiers: *Imperial Valley(Cal), *Sevier River(Utah).

An historical review of various proposals for classifying irrigation waters was presented. Limitations of some of the more commonly used criteria were mentioned. Salt balance and the need for a favorable salt balance in an irrigated area was explained. Leaching requirement was included in the discussion because of its relationship to the management of irrigation water. A study of the composition of irrigation water along several stream systems in relation to various criteria for classifying water was presented for the Rio Grande, the Sevier River in Utah, the Upper Basin of the Colorado River in Utah, and the Imperial Irrigation District. The discussion was limited to downstream uses for irrigation. Some conclusions were: (1) the development of irrigation projects along any river system where return flow enters the river results in some deterioration in the quality of downstream flow; (2) more efficient management of irrigation water should, at least temporarily, provide some improvement in the downstream water quality and possibly increase the downstream flow; and (3) from the long-term point of view, however, relatively little can be done in the way of more efficient management of the water resources on developed projects to improve the downstream water quality. B. O'Brien.
Mining Congress Journal, Vol 60, No 8, p 54-55, August, 1974.

Descriptors: *Toxicity, *Water pollution, Water law, Federal government, Regulation, Standards, Control.
Identifiers: The Water Act.

The Environmental Protection Agency has recommended to Congress that ammendments to the Water Act be made. An extension to three years for compliance with the toxic water pollution limitations will be requested. It is expected that the EPA will also ask for a transformation of the present formal hearings on proposed toxic regulations into informal proceedings. Russell Train, EPA Administrator, states that his organization is considering asking for authority to grant exemptions from the toxic limitations for a plant which is unable to meet the requirements due to no available technology for the treatment of the particular waste. The amendments should be submitted by the EPA to Congress in January of 1975. (Leibowitz-FIRL)

The Technical Committee of the Water Re Research Centers of the Thirteen Weste initiated a study to develop a water re planning methodology which would includ sessment or prediction of social achi resulting from investment in water development and use. Achievements pressed in terms of progress toward imp explicit national goals. Developed has Straw Man model, a hierarchical array broad goals disaggregated into layers of which are eventually linked to water polic variables through social indicators. Thi consists of papers resulting from the wor Phase II of the study. Since Phase I ident defined explicit national and regional g searched for connectives between these water-related activities, Phase II opted and quantize these connectives and analy important resource constraints to achi sistency in the model framework. The o jective was to narrow the gap between t tion of national goals and the implemen action programs to achieve such goals. T herein include a broad range of topics: ap of the Straw Man to the Dorfman-Jacob problems of methodology in applying Man; application of the methodology to

ndicators and connectives; application of mic modeling to the Straw Man ology; developing a significant information sharpening the definition of action varia- d questions and discussions relating to g and distribution. (See W75-10811 W75-10820) (Bell-Cornell)

rs: *Straw man, *Social goals, *Social in- Disaggregation, General welfare, Phelps model, Multi-objective, Economic ity, Disaggregation.

s been done to elucidate the important ween water resources development and vment of regional and national social s. The Straw Man planning methodolo- ver, attempts to describe regional and na- ls and to identify their relation to water . It disaggregates the over-arching goal l welfare into nine general goals (e.g., opportunity) which are successively by expanding strata of subgoals. Each e.g., employment opportunity) is linked olicy action variables by means of its so- tor (e.g., employment percentages). The tended as a predictive model or informa- tem, after quantitative connnectives water policy action variables and social are established and qualitative connec- ween social indicators and goals are preliminary transformation of the Dorf- by water supply and quality model into Man format is achieved. The Dorfman- odel is a political decision making st approach. Herein, the political varia- he model is sacrificed, while the single stic weighting scheme is retained. Use of an-Jacoby model in Straw Man format early demonstrates the role water play in the attainment of social objec- cidating the connectives between dif- ter development alternatives and com- als satisfaction. NDICATORS AND CONNECTIVES,
Univ., Riverside.

dings of the Graduate Student Symposi- e Technical Committee of the Water Centers of the Thirteen Western States, ptember 1972. 4 ref, 1 append.

s: *Water resources development, ogy, *Planning, *Water quality control, ects, Rivers, Dissolved oxygen, Gross oduct, Export, Income, Least squares egional analysis, Colorado River, Costs, Water utilization, Mathematical models, Systems analysis, Evaluation.
Social indicators, Connectives, *Straw nal goals, Linear regression, Economic y, Environmental quality, Disaggrega-

The nature of social indicators is examined, their use in the framework of the Straw Man methodology is discussed, and the dangers inherent in their interpretation are described. A social indicator is defined as 'a measure of any phenomenon that is socially significant,' such as employment percentages. It can be a scalar, vector, or a matrix, depending on the variables used in its construction. In the case of river pollution control, the social indicators expressing DO should be time and location specific. Social indicators used by various government agencies occasionally are less than representative of the information they are meant to portray. Ambiguity in interpretation is another problem inherent in the deciphering of social indicators. The social indicator is the most important link in the Straw Man system, allowing both flexibility and precision in measurement. In the collection of social indicators from existing research for use in the Straw Man model, their position in the disaggregation framework and their potential model use should be identified. The appendix includes examples of the collection format being used at UCR and Utah State. Considered are: regional export income as a social indicator; connective between gross national product and regional export income; connective between TDS and gross regional income in the lower Colorado River Basin; and the benefits of water quality enhancement. Connectives should be identified as to form, e.g., linear regression. (See also W75-10810) (Bell-Cornell)
W75-10812

**TOWARDS A SHARPER CONCEPT OF AN ACTION VARIABLE,**
Colorado State Univ., Fort Collins.
J. T. Davenport, and H. P. Caulfield, Jr.
In: Proceedings of the Graduate Student Symposium of the Technical Committee of the Water Resources Centers of the Thirteen Western States, p 65-84, September 1972. 3 fig, 1 tab, 7 ref, 1 append.

Descriptors: *Water resources development, *Methodology, *Planning, *Projects, *Water law, Federal jurisdiction, Flood control, Water quality control, Federal government, Multiple-purpose, Irrigation, Water policy, Social aspects, Economics, Graphical analysis, Recreation, Systems analysis.
Identifiers: *Straw Man, Action variables, Connectives, Social indicators, Public sector, Private sector, Environmental agencies.

Four key concepts are central to the Straw Man methodology: action variables, social indicators, subgoals and goals, and connectives. A more concise definition of an action variable is presented in the context of federal water law. The two central elements to an action variable are: (1) who is acting (actor), and (2) what general field of water resources development activity they are engaged in (action program). The actor can be a federal agency, a non-federal agency or private interests. Action programs can be irrigation, flood control, water quality enhancement, etc. The study of federal actors and their activities indicates that an action variable may be characterized by four components: (1) specific action of the actor, e.g., advise, design, operate, etc.; (2) legal constraints, e.g., the excess land provisions of the 1902 Reclamation Act; (3) alternative and supplementary action sets of other actors within the action program; and (4) other action programs possibly related to the primary action program, in light of multipurpose projects. Connectives between action variables and social indicators are best defined by studying the effects of employing action variables. An example is given wherein three graphs display a before-and-after effect on flood damage (expressed in dollars) of three different types of flood control measures. An appendix is included of several examples of federal and non-federal (public and private) action variables outlined in detail; considered are flood control, irrigated agriculture, outdoor recreation enhancement, and water quality enhancement. **METHODOLOGICAL PROBLEMS IN APPLYING THE STRAW MAN TO REAL LIFE PROBLEMS,**
Arizona Univ., Tucson.
R. M. Judge, F. H. Dove, and W. L. Everett.
In: Proceedings of the Graduate Student Symposium of the Technical Committee of the Water Resources Centers of the Thirteen Western States, p 85-103, September 1972. 1 fig, 2 ref, 1 append.

Descriptors: *Water resources development, *Methodology, *Planning, *Water pollution control, *Social aspects, Population growth, Environment, Shellfish, Industries, Management, Solid wastes, *Arizona, Projects, Systems analysis.
Identifiers: *Straw Man, Social indicators, Connectives, Environmental security, Individual security, Collective security, Disaggregation, Long Island.

Application of the Straw Man methodology to Pima County, Arizona and Suffolk County, New York water and solid waste management plans has revealed problems in definition, classification, and data collection for the Straw Man. Data collection requires much research to establish and describe the relationships between variables, many of them in the biological sphere. The data problem appears in two forms: the collection of information from primary, secondary or other sources and the definition of relationships between input variables and effects. Most problems occur in the physical-economic sphere where a physical impact, e.g., pollution, is to be related to an economic effect. An example concerns the effects of pollution on the shellfish industry of Long Island. Another problem of the Straw Man is one of editing. Study objectives include identifying those social indicators that are appropriate to the Straw Man in general and delineating a subset of these as appropriate to the two-county study. Considered are environmental, individual, and collective security. The two different demographic areas, drawing from groundwater supplies under different geological formations and historical management philosophies, have been studied in detail to estimate connectives between population increases, water and waste management actions and the social indicator set. Included is an appendix which gives a revision of the disaggregation of security goals. (See also W75-10810) (Bell-Cornell)

**QUALITATIVE SIGN MATRIX MANIPULATION,**
California Univ., Riverside.
T. Munnecke.
In: Proceedings of the Graduate Student Symposium of the Technical Committee of the Water Resources Centers of the Thirteen Western States, p 104-118, September 1972. 5 tab, 1 append.

Descriptors: *Water resources development, *Planning, *Evaluation, Decision making, Conferences, Computers, Social aspects, Equations, Mathematical models, Systems analysis.
Identifiers: *Straw Man, *Algebra of signs, Analysis of consistency, Qualitative information, Delphi method.

Presented are some possible mechanisms which may be used to integrate qualitative information into the Straw Man planning process. Qualitative specification of interactions within the Straw Man is a fairly tractable method of registering first order effects; however, the method fails when one tries to apply standard linear algebraic techniques. Social indicator and action variable connectives are qualitative values and may be handled using conventional linear algebra. Described is an algebra of sign matrices which will allow similar manipulations in the qualitative realm. The algebra

defined and properties described must be considered to be 'building blocks' of a system larger in scope. The most direct outcome of the algebra of signs is the identification of conflicting signs, from which other decision making methods may take over. The Delphi method is briefly described as a possible method to be interfaced to the problem. The literature describing this method seems to be a good base from which to begin further study. The appendix on an analysis of consistency presents a method which may be used to point out inconsistent decisions on the part of a planner. Also, it presents some theoretical concepts by which new information may be extrapolated from old. (See also W75-10810) (Bell-Cornell)

Identifiers: *Straw Man, *Information systems, Disaggregation, Action variables, Connectives.

Although the structure of the Straw Man methodology has been conceptualized in detail, the utilization of it has not been conceived very adequately. The difficulties expected in operating the system in the real planning process are discussed; the planning information system is assessed as a planning methodology. Two shortcomings of the system are low information content and no analytical capability; the former is inevitable by nature and the latter can be improved technically. The current information system is not helpful in the real planning process. Two major research directions to pursue are suggested: (1) make the system capable of producing information for any action alternatives of interest, and (2) create an action alternative generating system. In order to develop a consequence generating system and alternative generating system, further classification and disaggregation of action variables into a small number of basic components and the determination of connective rules between and/or among components are of primary necessity. **A METHOD OF DISAGGREGATION,**
Nevada Univ., Reno.
W. Jenkins.
In: Proceedings of the Graduate Student Symposium of the Technical Committee of the Water Resources Centers of the Thirteen Western States, p 128-141, September 1972. 1 tab, 4 ref.

Descriptors: *Water resources development, *Planning, *Methodology, *Evaluation, *Social aspects, Effects, Systems analysis.
Identifiers: *Straw Man, *Disaggregation, Interrogatives, Goals, Subgoals, Objectives, Aesthetic opportunity, Social indicators, Connectives.

A hierarchy of goals is a necessary part of an evaluation methodology for water resources planning and social goals which attempts to make proper connections between natural resource development and the nation's multitude of goals and objectives. Two basic conditions are required for the successful implementation of the goal hierarchy within a methodology such as the Straw Man: the goals and objectives must be accurately identified, and they must be represented adequately in an organized manner so that connectives may be made between goals and social indicators and between the goals themselves. It is felt that the second condition for implementation has not been satisfied in the Straw Man. Reviewed are some properties which should be included in the Straw Man and the reasons they are necessary to successful implementation of the goal hierarchy. A method of disaggregation is proposed as an aid to restructuring the Straw Man, and an example of application of this method to reconstruct the goal of aesthetic opportunity is presented. Considered in the example are highly- and little-developed areas, wilderness preserves, and recreational areas. The method of interrogatives used to disaggregate the goal into one level of subgoals is to ask a question designed to reveal pertinent information about the goal, so as to derive an answer which directly yields the subgoals of the disaggregation. Ultimately, the general goals can be successively described by expanding strata of subgoals which are eventually linked to potential water policy variables through social indicators. **EGALITARIANISM,**
Washington Univ., Seattle.
G. Jewett.
In: Proceedings of the Graduate Student Symposium of the Technical Committee of the Water Resources Centers of the Thirteen Western States, p 142-151, September 1972. 7 ref.

Descriptors: *Water resources, Economics, Education, Political aspects, Social aspects, Planning, Methodology, Regional analysis, Costs, Benefits, Environment, Natural resources, Systems analysis.
Identifiers: *Egalitarianism, Straw Man, Social justice, Equal distribution, Delphi method, National equality, Regional equality, Equal distribution, Diversity, Natural/social system.

Presented is a brief review of literature on egalitarianism. Highlighted are the conflict between the two fundamental American values of equality and achievement, and unfulfilled expectation that equality of results would follow from equality of opportunity, and distributive justice. It is suggested that we perhaps conceive of distributive justice in terms of equality -- egalitarian distribution of the good things in life. Indicators for economic, educational, and political equality are suggested. Questioned is how assessment of regional or national equality should be made in terms of equal distribution of costs and benefits, environmental trade-offs to natural systems, and natural systems in interaction with man/social systems. Recommendations are made concerning egalitarianism and the Straw Man. Considered are diversity/control interfaces: can equality and diversity co-exist within the same natural/social system. The Committee should investigate the possibilities and merits available to them in using a Delphi policy consensus methodology. (See also W75-10810) (Bell-Cornell)

**A CONNECTIVES MODEL RELATING WATER POLICY ACTION VARIABLES TO RECREATIONAL OPPORTUNITY SOCIAL INDICATORS,**
Utah State Univ., Logan.
R. Fletcher.
In: Proceedings of the Graduate Student Symposium of the Technical Committee of the Water Resources Centers of the Thirteen Western States, p 152-169, September 1972. 7 fig, 1 tab.

Descriptors: *Water resources, *Recreation, *Supply, Model studies, Analytical technique, Demand, *Water policy, Measurement, Swimming, Data collections, Economics, Evaluation, Alternative planning, Systems analysis, Computer models, Methodology.
Identifiers: Recreation opportunity, Social ind tors, Connectives, Tradeoff coefficient ma Compatibility matrix, Physical aspects, Biolog aspects.

Due to population growth and the interest i environment, demands on the water resource from all sectors have led to the need for redefi national goals and priorities concerning resource. This study considers the interac between the recreation sector and its w resource base. A supply model is proposed for swering the question, 'What kinds of, amounts and tradeoffs between recreational activities possible, given a condition of water quality, q tity, and distribution, and the nature of adja land and vegetation.' In developing the mo recreational activities are defined in terms of t general characteristics and/or limitations and further rated by a set of physical and biolog parameters which disqualifies or qualifies them good, fair, or poor activities. The model has parameters relevant to the qualification of ele activities. Then this activity 'kinds' m becomes an 'amounts' model, determining terms of the amount of user units per day, in w quantity the qualified activities can be perfor Two subsequent models consider the interact and tradeoffs between activities: (1) a trad coefficient matrix, and (2) a compatibility ma These matrices provide formulae from whic comprehensive set of feasible alternatives ma developed; supply costs, demand, and so economic inputs may be considered. **ALGORITHMIC MODELING AND THE STR MAN,**
Utah State Univ., Logan.
M. McKee.
In: Proceedings of the Graduate Student Symp um of the Technical Committee of the W Resources Centers of the Thirteen Western St p 170-185, September 1972. 6 ref.

Descriptors: *Water resources developm *Planning, *Simulation analysis, *Methodol Computer models, Decision making, Water po Evaluation, Social aspects, Comprehen planning, Alternative planning, Long-planning.
Identifiers: *Straw Man, Linkage mode Resiliency, System behavior, Sensitivity anal Boundary conditions, Prediction.

Failures in planning and decision ma processes occur sometimes from not unders ing the behavior of particular systems. A resou planning methodology, especially one as prehensive as the Straw Man, cannot rely s on the traditional means of data collection synthesis. Two important considerations, us ignored are discussed: (1) problems and im tions of integrating the concept of resiliency such planning methodology; and (2) the need sume a position of relative ignorance as to range and indirect consequences when pla resources usage. Resiliency refers to the sta or absorptive ability of a system. Examples o cost housing and pest control policies are where the implicit assumption of infinite s resiliency resulted in exceedence of the sys resiliency and ultimate collapse of the sy Ignorance refers to accepting the uncertaint policy implementation; the above policies because decisions were based on informatio sumed as being complete but found later to been incomplete and/or inaccurate. Consid therefore, is a method of systems simu potentially useful in predicting and understa complex physical/biological/social s behavior, especially regarding boundary c tions, affected by water resources develop An algorithmic method, developed at Utah University for studying desert ecosysten being utilized in conjunction with the Straw

methodology. (See also W75-10810) (Bell-

**PRINCIPLES AND STANDARDS FOR WATER PLANNING,**
Auburn Univ., Alabama. Dept. of Economics.
D. R. Street.
School of Business Research Series 4, November 1973, p5-7.

Descriptors: *Standards, *Welfare(Economics), *Planning, *Environment, *Regional development, Water resource development, Gross National Product, Discount rates, Economic efficiency, U.S. Water Resources Council.
Identifiers: *Opportunity cost, 'Principles and Standards'(1973).

Economic implication of the set of guidelines promulgated by the Water Resources Council, entitled 'Water and Related Land Resources--Establishment of Principles and Standards for Planning,' effective as of October 25, 1973 are discussed. 'Priciples and Standards' outline two objectives: (1) to enhance national economic development by increasing the GNP and by improving national efficiency, and (2) to enhance the quality of the environment by the management, conservation, preservation, creation, restoration, or improvement of the quality of certain natural and cultural resources and ecological systems. Four accounts to be used in developing alternative plans are delineated: one for each of the two objectives, one for regional development, and one for social well-being. The accounts of the new system are not additive and are not mutually exclusive. The national and regional economic development accounts use menetary measures, while the environmental quality and social factors accounts are largely attribute-type. The application of the objectives and accounts to specific projects is controversial. The qualitative nature of the regional development and social well-being data makes both difficult to evaluate. The WRC application of the concept of opportunity cost is a departure from the procedures of some accountants, especially with regards to discount rates. (See also W75-10354) (Becker-Wisconsin)

Descriptors: *Industrial production, *Industrial water, *Water pollution effects, *Economic impact, Water utilization, Income, Water demand, Regional analysis, Diseconomies of scale, Water quality, Input-output analysis.
Identifiers: *Industrial interdependencies, *Externalities.

External effects are present whenever a firm's production function depends on the activities of another firm. The concept of external effects in water-using firms is explained using input-output analysis. Economic sectors are specified in terms of the interdependence between water-using, non-water-using, and final demand sectors. For every acre-foot of water not available for use, the water-using sector will reduce purchases, which in turn reduces both income payments for the households and income spent on consumption goods. The case of the non-water-using sector being completely dependent on the raw material inputs from the water-using sector is discussed. The types of interdependency effects are: (1) a household income effect, (2) a business income effect on suppliers of production inputs and related sectors, and (3) on accumulative effect on the public sector through loss of revenues and reduction in use of public facilities. Specifically, the regional external effects on the public sector from water pollution include underutilization of public facilities in declining areas and the resulting economies and diseconomies of providing services. Externality effects are present to the extent that factors of production are immobile and unable to replace the income losses due to the decline in purchases by the water-using sector. Identifiers: Canberra(ACT).

A criticial study of the design of major storm drainage systems has been made with special reference to new urban growth centers, and with Canberra (Australia) as a model. The study reveals that public open spaces may be located on designed flood plains, thus preserving the environmental quality of the valley, reducing the storm peak discharges downstream and at the same time substantially reducing the overall cost of storm drainage works. Identifiers: Arno River, Amstel River(Netherlands), Limmat/Sihl Rivers(Aurich), Rhine River(Netherlands), Seine River, Ruhr River(Germany), Oise River, Marne River(France), Thames River, Lea River(London England), Tyne River(England), Charles River(Mass).

The most intensively used and abused resource on earth--the urgan river--is surveyed in terms of the crises of mismanaged rivers and wasteland riversides and the important aspects of progress in the conservation of the river landscape. A brief discussion is presented of the historical, economic, sociological, aesthetic and technical aspects of the problem. How fifteen major urban regions have utilized their river landscapes in the process of urban and regional development is described. The urban regions are: Florence (Arno); Venice (the canals); Amsterdam (Amstel/the canals); Paris (Seine); Paris region (Seine/Oise/Marne); Lyons (Saone/Rhone); Zurich (Limmat/Sihl); London (Thames); London (Lea); Ruhr region (Ruhr); Rotterdam (Rhine/Meuse); Tyneside (Tyne); Washington, D.C. (Potomac); Boston (Charles); New York (Hudson). Linking the old and new to provide recreational facilities and aesthetic setting by utilizing urban river landscapes (Amsterdam and Paris) is contrasted with situations created by heavy industrialization and growth problems along urban river banks (London and Tyneside). Encroachment of high-rise buildings, expressways, parking lots and ill-designed creation structures threaten riversides of Washington, D.C., Boston, Paris and Zurich. Use of knowledge and experience, sufficient funds, and planning on the broadest scale must be employed to preserve and promote urban riversides of high environmental quality. Identifiers: *Straw Man, *Social indicators, Connectives, Action variables, Tree structures, Metatheory, Axiomatic value theory, Disaggregation.

The Technical Committee, under the auspices of the Directors of the Water Resources Research Centers of the Thirteen Western States, initiated the development of a methodology relating water resources planning to the achievement of national and regional goals. The Committee developed the Straw Man, a model framework of connectives between social goals and water-related activities. In order to justify its logical structure, consistency, completeness, and underlying assumptions, a small review panel was asked to evaluate the taxonomic structure of the Straw Man. This volume, composed of three documents, is the resulting report. The first article is that of the Technical Committee -an introduction to the Straw Man methodology and a list of issues to be considered by the panel members. The second and third documents are evaluation reports by panel members. The Committee believes the interchange to have been helpful to the entire Straw Man project, particularly in distinguishing a prior issue in the methodology from ad hoc issues arising in its application. (See W75-10807 thru W75-10809) (Bell-Cornell)

**PANEL EVALUATION OF THE LOGICAL STRUCTURE, CONSISTENCY, AND UNDERLYING ASSUMPTIONS OF THE 'STRAWMAN' METHODOLOGY.**
California Univ., Riverside. Technical Committee of the Water Resources Centers of the Thirteen Western States.
In: Panel Review of the Taxonomic Structure of the Straw Man. Project No. DACW31-72-C-0060, Planning and Evaluation for the Straw Man Research Project. Report PRWG-120-3, University of California, Riverside. April, 1973. 6 p, 1 ref.

Descriptors: *Water resources development, *Methodology, *Evaluation, *Planning, *Social aspects, Behavior, Technology, Mathematical models, Systems analysis, Economics, Water policy.
Identifiers: *Straw Man, Disaggregation, Social indicators, Connectives, Action variables, Subgoals.

The Technical Committee of the Water Resources Centers of the Thirteen Western States has devised the Straw Man model for relating national and regional social goals to water resources planning and use decisions. The model is a hierarchical set of nine overarching general societal goals arrived at independently of water resources development. In the model, the goals are disaggregated into subgoals which are eventually linked to water policy action variables through social indicators (changes or events having social significance). The methodology is introduced and a list of issues to be considered by members of a panel formed to evaluate the taxonomic structure of the Straw Man is given. Since the set of nine general goals has not been tested for the degree of its completeness, a sharper delineation of each goal is recommended. (See also W75-10806) (Bell-Cornell)

**COMMENTS ON THE STRAW MAN,**
California Univ., Riverside. Dept. of Philosophy.
D. Harrah.
In: Panel Review of the Taxonomic Structure of the Straw Man. Project No. DACW31-72-C-0060, Planning and Evaluation for the Straw Man Research Project, Report PRWG-120-3, University of California, Riverside, April 1973. 17 p, 6 ref.

Descriptors: *Water resources development, *Methodology, *Evaluation, *Decision making, Planning, Social aspects, Mathematical models, Systems analysis, Water policy.
Identifiers: Straw Man, Disaggregation, Utility function, Decision theory, Tree structure, Axiomatic value theory.

The Technical Committee of the Water Resources Centers of the Thirteen Western States devised the Straw Man model for relating national and regional goals to water resources planning and decision making. The Straw Man methodology is evaluated and suggestions are made for extending and strengthening it. The Technical Committee's main aim is the development of a methodology for a two-level decision system appropriate in the context of decisions affecting water resources. Discussed are decision theory for the Straw Man goal system and the elements of a utility function suitable to the methodology. In the Straw Man, the utility function is constructed as a hierarchy of goals and subgoals, with utility weights assignable to the component goals and subgoals; t
hierarchy has a simple tree structure. Simplic
and clarity have been allowed to dominate t
need for theoretical richness and precision; t
value theory has been cast in too simple a for
and the requirements imposed on interpretatio
of the theory have been too strict. The theory
goals should be formulated as a hypothetic
deductive theory in axiomatic form--as an emp
cal theory of the value system of the social gr
in question. The tree structure would then
developed as a simplified representation of
theory, useful for computational and heuristic p
poses. Answers are included to questions posed
the Committee. (See also W75-10806) (Bell-C
nell)

The Straw Man methodology has been devis
relate national and regional goals to
resources development. The overall conce
that, by taking certain actions, decision m
can realize particular goals and their assoc
values. The ethical assumptions of the Straw
methodology are considered. The method pr
poses an idea of how decisions are made,
values are assigned, and of how results can b
tained by balancing multiple relevant consi
tions. This idea is too simple, with not en
thought given to the relation between th
dividual factors. The methodology has bee
fered as a replacement for the crude eco
cost-benefit analysis which has until re
governed public water policy decisions. Th
has been to extend the range of consideration
will influence decision making by including
other than economic ones, with hopes of bala
the costs against benefits. More complex
tures are needed to accomplish this. Cons
tions which determine a rational choice are d
into three categories: (1) assignment of pr
values; (2) distributional factors; and (3) pro
straints on means to be used in pursuit of
These considerations are discussed in de
terms of human values, equality, and ethic
amined are utilitarianism, satisfactio
preferences, and individual rights. Recomm
tions are made for improving the Straw
ideology, and thus methodology. (See also

Identifiers: Dewey Reservoir(Kent), Rough River Reservoir(Kent).

Recreation visitation to two Kentucky reservoirs (Rough River and Dewey) constructed by the U.S. Army Corps of Engineers was studied to develop mathematical expressions for estimating numbers of visitors and recreation benefits. Regression analysis was used to relate characteristics of 168 origin areas (120 Kentucky counties, the District of Columbia, and the remaining states excluding Hawaii and Alaska) to visitation from that area to Rough River Reservoir. The resulting equations were than applied to Dewey to test their generality. Good results were obtained when only air distance and population were used as the independent variables. Correlations including the age and income of the population, urbanization, highway quality, and competition from other reservoirs did not significantly improve the results for Rough River and resulted in a worse correlation when applied to Dewey. Recreation benefits from the two reservoirs were estimated from a demand curve where the cost of effective travel distance was used to estimate price and the regression equation was used to estimate visitation. The effective or out-of-the-way distance (as contrasted with total distance) to the reservoir was estimated. (Huffsey-Kentucky)

**THE EFFECT OF LANDOWNER ATTITUDE ON THE FINANCIAL AND THE ECONOMIC COSTS OF ACQUIRING LAND FOR A LARGE PUBLIC WORKS PROJECT,**
Kentucky Water Resources Inst., Lexington.
J. M. Higgins, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 536, $6.25 in paper copy, $2.25 in microfiche. Research Report No 3, 1967. 153 p, 10 fig, 16 tab, 28 ref. OWRR A-006-KY. 14-01-0001-787.

Descriptors: Land appraisals, Land use, *Econometrics, Financial feasibility, *Attitudes, *Kentucky, Costs, *Property values, Cost analysis, Reservoirs.
Identifiers: Landowners.

The purpose is to examine the various economic and financial costs relating to the acquisition of property required for the construction of three reservoirs and to determine if any correlation could be made between the attitudes of the landowners selling property and the costs. Rough River Reservoir, Dewey Reservoir, and West Fork of Mill Creek Reservoir were studied. The costs involved in purchasing right-of-way were classified qualitatively and quantified to the extent possible. A procedure was devised to quantify 15 factors influencing attitude and an equation was derived to predict the landowner's attitude from these determining factors. Two plots were made of attitude versus the associated costs in order to observe the effect of attitude on costs. The results indicate that although the problem is complex, it is possible and practical to quantify the landowner's attitude and to define the relationship between this attitude and the associated costs. Descriptors: Reservoirs, Tax rates, Taxes, Flood control, Recreation, *Cost-benefit ratio, *Kentucky, Economics, *Income analysis, *Income distribution, Benefits, Taxes, Flood damage, Reviews.
Identifiers: Dewey Reservoir(Kent).

The economic effects of the construction of Dewey Reservoir in Floyd County, Kentucky were evaluated. Primary emphasis was placed on determining the degree the project had shifted income to this economically underdeveloped area by determining the incomes of those receiving project benefits and those paying project costs. The income redistribution effects of all benefits and costs associated with Dewey Reservoir were evaluated by assuming that the Federal income tax structure indicates the marginal value of income to individuals in the various income brackets. Major benefits from the Dewey Project have been: flood control, $722,166 annually, and recreation, $814,720 annually. Comparing these benefits with the average annual cost of the project yeilds a direct benefit cost ratio of 1.58. The flood damage reduction benefits have negative redistribution effects (-$77,670), because those receiving the benefits have incomes higher than that of the average taxpayer. The positive income redistribution benefits in decreasing order resulted from: repayment incidence ($197,860), recreation benefits ($133,720), project expenditures ($26,618), and Mississippi River benefits ($294). ## 6C. Cost Allocation, Cost Sharing, Pricing/Repayment

**ANALYZING REIMBURSEMENT MECHANISMS FOR RESOURCE DEVELOPMENT PROJECTS,**
Wyoming Univ., Laramie. Div. of Agricultural Economics.
T. L. Dobbs, and C. E. Huff.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 917, $3.25 in paper copy, $2.25 in microfiche. Wyoming Agricultural Experiment Station Journal Article No 652, 1974, 25 p, 2 tab, 22 ref. OWRT C-4351(9063)(2).

Descriptors: *Water resources development, *Cost repayment, *Economic impact, *Social impact, Inter-basin transfers, Regional development, Economic efficiency, Equity, Wyoming, Methodology, Decision making.
Identifiers: Development cost reimbursement, Case study.

Policies proposed by the National Water Commission will create a need for a systematic examination of possible reimbursement mechanisms for project bonded indebtedness and operation and maintenance costs. Increased reliance on the assessment of beneficiaries and the necessity of integrating project evaluation and cost-sharing formulation for water resource development projects are stressed. A framework for analyzing regional resource development projects is developed around an impact matrix and a reimbursement matrix. The impact matrix includes the various development, environmental/recreational, and socical effects of a project on various sectors within the region of concern, while the reimbursement matrix accounts for all user charges, taxes, and other repayment mechanisms. The analytical framework is applied to a proposed interbasin water transfer project involving water transfer from Wyoming's Green River to its North Platte River Basin for municipal and industrial (coal development) purposes. Positive and negative regional effects of the project were estimated from secondary sources for one county to be affected. Criteria set forth to be used in evaluating reimbursement mechanisms are: (1) efficiency, (2) equity, (3) revenue raising ability, and (4) administrative feasibility. The framework presented facilitates examination of marginal-cost pricing, public finance, and public utility-type reimbursement mechanisms. (Becker-Wisconsin)

**DERIVED DECISION RULES FOR POLLUTION CONTROL IN A GENERAL EQUILIBRIUM SPACE ECONOMY,**
Williams Coll., Williamstown, Mass. Dept. of Economics.
T. H. Tietenberg.
Journal of Environmental Economics and Management, Vol 1, No 1, p 3-16, 1974.

Descriptors: *Pollution abatement, *Decision making, *Pollution taxes(Charges), *Theoretical analysis, Resource allocation, Costs, Tax rates, Welfare(Economics), Mathematical models, Equations, Intangible costs.

The conventional externality model is expanded to include spatial detail and by using this model theorems are provided (which require no information on either damage costs or control costs) as the basis for reducing the information content of desirable pollution control policies. This spatially defined general equilibrium model defines and characterizes cost minimizing and efficient resource allocation. Institutional content is introduced and resource allocations which characterize decentralized equilibria are described in the context of a private ownership space economy containing a government which imposes specific taxes on emitters. Three theorems of the allocations are proven under alternative assumptions, two of which provide a basis for easily computable tax structures. The modified model includes a description of an externality which is related to meteorology and hydrology of air and water pollution. The model was also used to derive a theorem concerning efficient externality control using specific taxes. It is demonstrated that several decision rules which require considerably less information can be derived from this model by sacrificing some but not all of the properties of efficiency. Thus, while there is no focus on optimality of any of the derived decision rules, they do represent alternatives with somewhat more clearly delineated properties. (Auen-Wisconsin)

**POLITICAL PARTICIPATION AND WATER RATES. A CLOSER LOOK,**
California Univ., Santa Barbara.
L. J. Mercer, and W. D. Morgan.
Water Resources Bulletin, Vol 10, No 6, p 1302-1307, 1974. 1 tab, 4 ref.

Descriptors: *Water rates, *Political aspects, *Mathematical models, Average prices, Pricing, Income, Costs, Water districts, Metropolitan Water Dist. of So. Cal.
Identifiers: Public participation.

Patrick Mann's (Water Resources Bulletin Vol 9, No 5: 976-984, Oct 1973) conclusions that increased political activity results in lower water rates are questioned because of potential misspecification of his underlying model and the general weakness of this political variable. Among some other equations evaluated are (1) his results for the Mountain, Pacific, and West North Central states, which are based on the dominance of the Western sub-region without considering the institutional characteristics which exist in the West, particularly in the arid West; the Western states receive water supplied by the Bureau of Reclamation at a price lower than resource costs thus the rate structures would be lower. (2) Some states, particularly California, have granted water agencies access to additional revenue by permitting them to levy a property tax, which Mann's model misspecified by omitting the variable for other revenue sources. (3) The dependent variable should be the average water rate since the quantity for which the minimum rate applies varies widely across water agencies. (4) The political proxy variable used could distort the actual level of political activity. It is concluded that the case for the hypothesis that political influence of residential consumers (as measured by Mann) has significant impact on water rates is less than satisfactory. (Auen-Wisconsin)

**ON THE PEAK-LOAD PRICING OF URBAN WATER SUPPLY,**
Clark Univ., Worcester, Mass. Graduate School of Geography.
S. L. Feldman.
Water Resources Research, Vol 11, No 2, p 355-356, April 1975. 10 ref.

Descriptors: *Water demand, *Prices, Flow measurement, *Peak loads, *Elasticity of demand, Water allocation(Policy), Water costs, *Water supply, Economics, Instrumentation, Data collections, Telemetry, Water measurement, Equity, Pressure head, Water distribution(Applied).
Identifiers: *Peak-load pricing, Maximum day, Peak-hour, *Urban water supply.

Since summer lawn sprinkling water demands account for a large portion of water supply system design, a seasonal commodity charge has been suggested by Hanke and Davis. A more 'responsive' system of charges is proposed that has maximum day and peak-hour (plus fire flow) parameters which account for 85% of municipal water system costs. Thus a peak-hour pricing scheme would encourage restricted consumption at the specific peaks rather than throughout the summer. Fire flow pressure and the social externalities of green lawns could be assured in a more equitable peak-load pricing. Commercial and industrial users and residences with irrigable areas would be fitted with peak load meters if their water use justified the expense. A completely mechanical meter which shifts to different register scales with the decrease in pressure occurs during periods of greater demand could increase the price per gallon during these peak flows periods. Alternatively, remote control telemetering techniques now being used for meter reading could enable the utility to change its customers' meters to a different scale during maximum day and peak-hour periods. Consumers would be encouraged to sprinkle at incentive prices during off-peak hours. Average rates could be lowered as system demand peaks were shaved and troughs filled and the system used more efficiently. (Herr-North Carolina)

**WATER RATES: AN ASSESSMENT OF CURRENT ISSUES,**
California Univ., Berkeley.
S. H. Hanke.
Journal of the American Water Works Association, Vol 67, No 5, p 215-219, May, 1975. 1 fig, 21 ref.

Descriptors: *Water rates, *Pricing, *Water costs, *Water demand, *Economic efficiency, Economics of scale, Unit costs, Average costs, Economic impact, Elasticity of demand, Planning, Financing, Equity, Cost allocation, Incremental income.
Identifiers: Washington Suburban Sanitation Commission(MD), Denver Water Board(CO), East Bay Municipal Utilities District(Oakland CA), Fairfax County Water Authority(VA).

Tradiational water pricing policies have been based on accounting costs. Rate structures have had a fixed charge per unit time and declining-block commodity charges designed to generate needed revenue. Physical and financial planning have been separate activities, as pricing was based on historical average costs. The economic approach bases pricing on marginal or incremental costs, insuring more efficient resource allocation. Prices reflect the value of resources used or saved by a change in consumption. Demand, and therefore physical planning, depends in part on the price per unit of water. Rate structures u
average costs create the illusion of uniform co
Most major water system facilities are desig

**ECONOMIC IMPACT OF THE CONVERSION OF WATER FROM IRRIGATION TO MUNICIPAL AND INDUSTRIAL USE IN THE RIO GRANDE BASIN OF NEW MEXICO,**
New Mexico State Engineer, Santa Fe.
E. A. Lewis.
In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 67-84, 1974. 18 ref.

Descriptors: *Water policy, *Irrigation water, *Municipal water, *Industrial water, *New Mexico, *Rio Grande River, Projections, Planning, Urbanization, Estimating, Water allocation(Policy), Model studies, Mathematical models, Economics, Irrigation, Industry, Agriculture, Rivers, Groundwater, Water utilization, Water requirements.

The preparation of a planning report on the New Mexico State Water Plan is under way. Assuming augmentation is not available and if projected requirements are to be met, there will have to be changes in water use. An economic model may provide a means of measuring the economic impacts of such changes. This model is a linear programming model designed to represent New Mexico's economy. Retiring irrigation water rights to meet municipal, industrial, and recreational water demands is presently taking place in the state. It is assumed this will continue. The logic of this assumption is based on economics and the fact that irrigation is the only use which is large enough to supply the anticipated increased demands for water. The model is being used to project the water uses in the Rio Grande Basin of New Mexico to 1980, 2000, and 2020, using 1970 data as input, The economic impacts of these changes in water uses are being evaluated. Due to some difficulties in model building, reasonable results were not obtained in time for this paper. The water problems of the Rio Grande Basin were discussed, and the model was described. **IMPACTS OF RURAL TO URBAN WATER USE,**
Texas Office of the Governor, Austin. Water Task Force.
J. O. Williams.
In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 85-98, 1974. 2 fig, 3 tab, 1 ref.

Descriptors: *Water policy, *Urbanization, *Water demand, Urban sociology, Land use, Economics. Water importing, Groundwater, Irrigation, *Municipal water, Environmental effects, Social impact, Social change, Political aspects, Federal government, State governments, Governmental interrelations, Population, Distribution patterns, Water use, Water supply.

In 1930, 43.7% of the nation's population was classified by the Bureau of Census as residing in rural areas, with the remaining 56.3% identified as urban dwellers. By 1970, the rural population had dropped to 26.5% and the percentage of urban inhabitants had climbed to 73.5%. In 1930, out of a total water withdrawal of 110 billion gallons per day for all purposes, 60 billion gallons per day were used in irrigated agriculture, 8 billion gallons per day for public water utilities, 2.9 billion gallons per day for rural domestic uses, 21 billion gallons per day for industrial and miscellaneous, and 18 for steam electric utilities. By 1970, total water withdrawal had more than tripled to 370 billion gallons per day, irrigation use had more than doubled to 130 billion gallons per day, and public water utilities accounted for 27 billion gallons per day. A substantial research effort should go into the development of methodologies that would enable the state and federal levels of government to address the entire spectrum of land and water use problems that have been associated with or caused by the rural to urban shift that has taken place in this nation. Descriptors: *Pollution taxes(Charges), Marginal costs, Resource allocation, Mathematical studies, Tax rates, Marginal costs.

Those concerned with controlling pollution by taxation face the difficulty of identifying the optimum tax and often there is the problem of deciding how it is more economical to clean up pollutants by some collective private or public facility than to induce polluters to abate their own effluent in an uncoordinated manner in response to a pollution tax or direct regulation. A theoretical model is devised which features the introduction, into both the comsumption and production function of the economy of (1) the pollutant and (2) some 'anti-pollutant,' such as water purification facilities or soundproofing--to be regarded as 'bads' and 'anti-bads,' which contribute to the identification of an optimum tax for the generation of pollutants when both 'anti-bands' and 'bads' are included in the utility function. 'Bads' and 'anti-bads' are introduced via a technological tradeoff relationship

with substitution allowed. In some instances in order to determine the optimum tax it may not be important to know the marginal damage function. The tradeoffs between private actions to reduce the effect of pollutants and collective provisions for pollutant control are analyzed. Under certain circumstances the appropriate tax on polluters can be calculated from observed defensive behavior of the receptors. (Auen-Wisconsin)

Descriptors: *Environmental effects, *Channel improvement, *Flood control, *Engineering structures, Environment, Environmental engineering, Project planning, Erosion control, Sediment control, Soil conservation, Economic justification, Costs, Project benefits, Trees, Wetlands, Drainage, Ecology, Hardwood, Streams, Water table.
Identifiers: Bottomland clearing.

Conservationists and environmentalists feel strongly that channel projects are in many cases unnecessarily damaging the natural amenities of streams and streamsides. Most frequent criticisms concern draining of wetlands, cutting off oxbows and meanders, clearing bottomland hardwoods, and altering water tables. Criticism has extended to the economic justification, formulation, and operation and maintenance of federally assisted projects. This concern is countered by the need to protect and improve the human environment, the quality of other natural resources, and our standard of living. Compromise between these values is essential if we are to maintain our standard of living and reasonably protect our environment. About 34,240 miles in 1630 federal or federally assisted projects have been modified or planned for modification by the Corps of Engineers and the Soil Conservation Service. Beginning largely with the National Environmental Policy Act of 1969, major changes began taking place in the formulation of federally assisted water development projects. Engineers can substantially minimize adverse environmental impacts by using imaginative designs. Cost sharing for nonstructural measures should be equated with those for structural measures to promote objective development in the best interest of the public. (See also W75-10769) (Sims-ISWS)

**AN AUTOMATIC DATA ACQUISITION AND REDUCTION SYSTEM,**
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
R. A. Sommerfeld.
Research Note RM-260, April 1974. 4 p, 5 fig.

Descriptors: On-site data collection, Data processing, Instrumentation, Automation.
Identifiers: Data acquisition, Data reduction.

A system for recording and automatically reducing up to 41 channels slowly varying data has been designed. For recording, the data are multiplexed into a very slow speed, analog tape recorder. Playback can be done at speeds up to 1000 times as fast as the recording speed, using a 60 IPS tape playback unit. A digital clock provides time control and the data are digitized and punched onto paper tape at playback. The paper tape can then be used to input the data to conventional computer systems for various analysis and editing operations. The cost of the system is comparable to high reliability strip charts, for the same number of channels. Total system accuracy for input voltages in the ranges plus or minus 0.1 to plus or minus 10 v is plus or minus 0.3 percent. (Forest Service)

**MEASUREMENT OF HYDRAULIC CONDUCTIVITY OF PEATS,**
Guelph Univ. (Ontario). Dept. of Botany and Genetics.
T. S. Dai, and J. H. Sparling.
Canadian Journal of Soil Science, Vol 53, No 1, p 21-26, 1973, Illus. (Fr. summ.).

Descriptors: *Hydraulic conductivity, *Peat, *Canada, Measurement, Darcys Law, Bogs, Fen, Piezometers, Piezometry.

The measurement of hydraulic conductivity of peats in a northeastern Ontario, Canada, peatland is described. Several sizes of piezometer were tested and revealed little effect on the hydraulic conductivity. Various lengths of piezometer chamber were used to measure both vertical and horizontal components of hydraulic conductivity at a number of sites. Open bog sites had a higher vertical component of hydraulic conductivity than the poor fen site. The poor fen site exhibited a greater dependence of the hydraulic conductivity on piezometer chamber length than the open bog site, indicating a greater horizontal component of the hydraulic conductivity. A significant correlation between the differential heads and hydraulic conductivity is demonstrated. This indicates a deviation of Darcian flow in the peatland. The ratios of differential heads in piezometer are constant however, and therefore the proportionality of Darcy's Law is exhibited by the piezometer method.--Copyright 1973, Biological Abstracts, Inc.

**ERROR ANALYSIS OF DOBSON SPECTROPHOTOMETER MEASUREMENTS OF THE TOTAL ATMOSPHERIC OZONE CONTENT,**
National Aeronautics and Space Administration, Wallops Island, Va. Wallops Station.
A. C. Holland, and R. W. L. Thomas.
Available from the National Technical Information Service, Springfield, Va 22161 as NASA TN D-7877, $3.75 in paper copy, $2.25 in microfiche. NASA Technical Note D-7877, March 1975. 29 p, 8 fig, 6 tab, 13 ref, 1 append.

Descriptors: *Ozone, *Measurement, *Spectrometers, *Radiation, Spectrophotometry, Model studies, Atmosphere, Absorption, Solar radiation, Monte Carlo method, Mathematical studies, Aerosols, Remote sensing.
Identifiers: *Dobson spectrophotometer, Error analysis.

The amount of ozone present in the earth's atmosphere is of considerable interest to the scientific community because of its role in the transfer of solar energy in the atmosphere, absorbing harmful ultraviolet radiation, and providing a source of thermal energy in the stratosphere. The Dobson spectrophotometer has served as a standard ground-based instrument for the measurement of total atmospheric ozone for over two decades. In order to assess the accuracy of the total ozone inferred from Dobson measurements a study was initiated several years ago. The first phase of that study concluded that single and multiple scattering can contribute significant errors to the amount of ozone inferred from direct sun measurements. This report described the second phase of the study which was concerned with the errors in the total ozone amount estimated from Dobson direct sun measurements for standard atmospheres ranging from tropical through subarctic conditions. (Sims-ISWS)

**FLOOD HAZARDS IN THE SEATTLE-TACOMA URBAN COMPLEX AND ADJACENT AREAS, WASHINGTON,**
Geological Survey, Tacoma, Wash.
B. L. Foxworthy, and E. G. Nassar.
Open-file report (Basic-data contribution 5), 1975. 1 sheet, 2 fig, 11 ref.

Descriptors: *Floods, *Flood damage, *Flood control, *Washington, Streamflow, Runoff, Maps, Snowmelt, Mudflows, Glaciers, Volcanoes, Hydrologic data, Evaluation, Planning, Urban hydrology.
Identifiers: *Flood hazards, *Seattle-Tacoma area(Wash), Coastal flooding.

This one-sheet atlas of the Seattle-Tacoma urban area, Washington, Briefly describes flood hazards, including some that may be unique to the Puget Sound basin; indicates the parts of the area for which flood-hazard data are available; and lists the main sources of hydrologic information that is useful for flood-hazard analysis in conjunction with long-range planning. By far the most common type of flooding in the Pudget Sound basin is that caused by excessive runoff from storm precipitation, often augmented by melting of snow. This is the type of flooding to which most of the existing flood-hazard data pertain. As the floodwaters rise and spread farther across the flood plain, increasingly larger floodflows can be accommodated with only small additional rises in water levels. Accordingly, a flood having a recurrence interval of 100 years may not inundate much more land than a flood of 50-year recurrence interval. The relative flood stages of a typical, unregulated stream are shown diagrammaticall. (Woodard-USGS)

**HYDROGEOLOGIC DATA FOR THE FARMINGTON RIVER BASIN, CONNECTICUT,**
Geological Survey, Hartford, Conn.
H. T. Hopkins, and E. H. Handman.
Connecticut Water Resources Bulletin No 28, 1975. 49 p, 1 fig, 1 plate, 5 tab, 9 ref.

Descriptors: *Hydrologic data, *Groundwater resources, *Basic data collections, *Test wells, *Connecticut, Massachusetts, Water wells, Drilling, Well data, Water levels, Pumping, Water yield, Drawdown, Observation wells, Drillers logs, Aquifer characteristics, Geology, Water utilization.
Identifiers: *Farmington River basin(Conn).

Hydrologic and geologic data were collected and compiled by the U.S. Geological Survey in cooperation with the Connecticut Department of Environmental Protection as part of a water resources investigation of the Farmington River basin, Connecticut. The Farmington River drains a 601-square-mile area in southwestern Massachusetts and north-central Connecticut. As defined for this report the Farmington River basin is restricted to 416 square miles in Connecticut. Some supporting data were collected in Massachusetts. The study area includes all or parts of the following towns: Avon, Barkhamsted, Bristol, Burlington, Canton, Colebrook, East Granby, Farmington, Granby, Hartland, Harwinton, New Hartford, Norfolk, Plainville, Plymouth, Simsbury, Suffield, Torrington, Winchester, and Wolcott. Data were collected from July 1970 to December 1972 and are supplemented by data collected during previous investigations. Fifty-three test holes were augered in areas of stratified drift. Logs are tabulated for these test holes and sieve analyses are shown for samples collected from selected holes. (Woodard-USGS)

**HYDROLOGICAL DATA FROM WELLS IN SOUTHWEST HILLSBOROUGH COUNTY, FLORIDA, 1950-74,**
Geological Survey, Tallahassee, Fla.
A. D. Duerr.
Open-file report FL 74031, 1975. 53 p, 3 fig, 4 tab, 5 ref.

Descriptors: *Hydrologic data, *Water wells, *Florida, *Basic data collections, Water levels, Water quality, Chemical analysis, Well data.
Identifiers: *Southwest Hillsborough County(Fla).

A study of the water resources of southwest Hillsborough County, Fla., was made during 1971-74 to determine the hydrologic effects of groundwater withdrawals on water levels and water quality in a coastal area undergoing rapid urbanization. The study area includes about 200 square miles of southwest Hillsborough County adjacent to Tampa Bay and Manatee County. Data from 258 wells tapping the artesian aquifers include tables of well records, water-level measurements, and water-quality analyses of samples collected. In addition, earlier data published by Peek (1959) and Menke, Meredith, and Wetterhall (1961 and 1964) are included to show water-level and water-quality changes in selected wells over a 20-year period. (Woodard-USGS)

Geological Survey, Menlo Park, Calif.
J. H. Koehler.
Open-file map, 1974. 1 sheet, 1 map.

Descriptors: *Maps, *Water levels, *Groundwater, *Water wells, *California, Contours, Sites, Stations, Aquifers, Groundwater basins.
Identifiers: *Antelope Valley area(Calif).

This map, scale 1/2 inch equals approximately 1 mile, of the Antelope Valley -- East Kern Water Agency Area, California, shows groundwater subunits and areas, location of wells, and water-level contours for spring 1974. Well locations for monitoring water-quality changes also are shown. (Woodard-USGS)
W75-10595

**HYDROLOGIC DATA FOR URBAN STUDIES IN THE FORT WORTH, TEXAS METROPOLITAN AREA, 1973,**
Geological Survey, Austin, Tex.
B. B. Hampton.

Open-file report, May 1975. 129 p, 3 fig, 5 tab.

Descriptors: *Hydrologic data, *Urban hydrology, *Floods, *Urbanization, *Texas, Flood frequency, Flood peak, Flood profiles, Data collections, Rainfall, Runoff, Storms, Evaluation, Mass curves, Hydrographs.
Identifiers: *Fort Worth(Tex).

In October 1968, the Geological Survey in cooperation with the city of Fort Worth Department of Public Works began a program of hydrologic investigations on several small streams in Fort Worth, Tex. The investigations are designed to evaluate factors affecting floods on small streams in the metropolitan area. Studies of additional streams, one of which drains beneath the impervious area of a shopping center, were added to the program in October 1969. The objectives of the program are: (1) To determine, on the basis of historical data and hydrologic analyses, the magnitude and frequency of floods; (2) to document and define the areal extent of floods of greater than ordinary magnitude; and (3) to determine the effect of urban development on flood peaks and volume. Basic hydrologic data collected in four study areas during the 1973 water year (October 1, 1972-September 30, 1973) are presented. The four study areas are Sycamore Creek, Sycamore Creek tributary, Dry Branch, and Little Fossil Creek. The Sycamore Creek tributary study area includes the highly impervious area of the Seminary South Shopping Center as a subarea. (Woodard-USGS)

H. W. Lowham, J. E. Kircher, and F. C. Boner.
Wyoming State Water Planning Program, Cheyenne, Report No 15, July 1975. 114 p, 2 fig, 6 ref.

Descriptors: *Water temperature, *Basic data collections, *Streams, *Wyoming, Gaging stations, Sites, Measurement.

These data were assembled in response to a growing need for baseline information concerning water temperatures of Wyoming streams. Water temperatures are important to many water users. Beginning in about 1950, observations of water temperature in Wyoming were obtained whenever discharge measurements were made by the U.S. Geological Survey. Most of these temperature observations have never been published. Previously unpublished data are presented in graphical form for 207 streamflow stations. (Woodard-USGS)

**A NUMERICAL MODEL FOR PREDICTING THE EFFECTS OF LANDSLIDE-GENERATED WATER WAVES,**
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
D. C. Raney, and H. L. Butler.
Available from the National Technical Information Service, Springfield, Va 22161. Research Report H-75-1, February 1975. 42 p, 8 fig, 1 tab, 5 photo, 5 pl, 3 append, 12 ref.

Descriptors: *Landslides, *Mathematical mode
*Reservoirs, Forecasting, *Model studies.
Identifiers: *Water wave generation.

A numerical model for the generation a propagation of landslide-generated water waves reservoirs is developed. Only two-dimensio hydrodynamic quantities are obtained from t program; however, a pseudo three-dimensional- fect is present since the three-dimensio geometry of an actual reservoir can represented. The model provides an approach the evaluation of the first wave crest that r result from potential landslide regions located reservoirs. Arbitrary landslide volumes, reserv depths, slide propagation velocity, slide sha and initial and final location of the slide can considered. The numerical results have been co pared with experimental results obtained o 1:120 undistorted scale model of Libby Dam Lake Koocanusa in Montana. The numeri results for the height of the first wave crest and time of arrival at various points in the reservoir in good agreement with the experimentally m sured values from the hydraulic model. Appen A gives data requirements for the numeri model; Appendix B is an analysis of viscous d and pressure drag coefficients; and Appendix lists and defines symbols used in this rep (WES)

**NORTON POINT DIKE STUDY, CONEY ISLAND, NEW YORK; HYDRAULIC MODEL INVESTIGATION,**
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. F. Athow, Jr., R. A. Sager, and W. H. Bobb.
Available from the National Technical Information Service, Springfield, Va 22161. Miscellaneous Paper H-75-2, April 1975. 267 p, 6 fig, 26 tab, 26 photo, 176 pl, 3 ref.

Descriptors: *Hydraulic models, *Salinity, *Dye dispersion, *Dikes, *New York, Model studies, Tidal waters.
Identifiers: *Deflection dikes, Coney Island Beach(NY), *Current velocity, *Norton Point Dike(NY), *Tidal currents.

An existing comprehensive physical model that correctly reproduced tides, tidal currents, and density currents throughout the entire New York Harbor was used to determine the effects of constructing a current deflection dike at Norton Point, Coney Island, New York. The study included tests in the model to define the effects of the dike on tidal heights, current velocities, surface current patterns, salinities, and the distribution of dye from four sources throughout the New York Harbor complex. Based on results of the model tests, it was shown that the Norton Point dike would have the following effects in the study area: (a) local current patterns would be changed and a continuous east-west current would be set up along the Coney Island beaches, (b) tidal heights and tidal phasing as well as the salinity regime would not be affected significantly, (c) sediment buildup behind the dike would be encouraged. (d) very little flushing of the waters behind the dike would occur in the period while the area is being filled by the littoral drift, and (e) concentration of pollution from the Passaic Valley Outfall showed a slight net decrease at low-water slack along Coney Island, but a significant net increase at high-water slack. **WAIMANO STREAM FLOOD CONTROL PROJECT, PEARL CITY, HAWAII; HYDRAULIC MODEL INVESTIGATION,**
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
P. E. Saunders.
Available from the National Technical Information Service, Springfield, Va 22161 as AD/A-006 020, $4.25 in paper copy, $2.25 in microfiche. Technical Report H-75-3, January 1975. 52 p, 3 fig, 9 photo, 14 pl, 2 append.

Descriptors: *Flood control, *Hydraulic models, *Open channel flow, Model studies, *Hawaii.
Identifiers: *High velocity flow, Pearl City(HI), *Waimano Stream (HI).

Tests were conducted on an undistorted, 1:20-scale physical model of the high-velocity channel for Waimano Stream to determine the adequacy of the sinuous channel to pass discharges as large as 6300 cfs. Since right-of-way limitations prevented major realignment of the proposed channel, superelevated curves were more severe than those recommended by current design guidance. The entering transition section was modified to improve flow conditions. Also, the superelevation was increased and the curve modified in several locations to improve flow distribution. The Moanalua Road drains were modified to improve flow conditions at their confluence with the main channel and the entrances to the relief drain and the diversion channel were modified to facilitate passage of the required flows. **LOS ANGELES AND LONG BEACH HARBORS MODEL STUDY; REPORT 2, OBSERVATIONS OF SHIP MOORING AND MOVEMENT,**
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
L. G. Crosby, and D. L. Durham.
Available from the National Technical Information Service, Springfield, Va 22161 as AD/A-005 149, $5.75 in paper copy, $2.25 in microfiche. Technical Report H-75-4, January 1975 (Report 2 of a series). 189 p, 5 fig, 12 tab.

Descriptors: *Mathematical models, *Model studies, *California, Ships, Harbors.
Identifiers: *Long Beach Harbor(Cal), *Los Angeles Harbor(Cal), *Mooring, Ship motion.

From March 1971 to July 1972, records of reported ship movements for four locations in Los Angeles and Long Beach Harbors were collected and maintained by the U.S. Army Engineer District, Los Angeles, and numerically coded onto computer cards. These cards were transmitted to the U.S. Army Engineer Waterways Experiment Station where they were computer analyzed and arranged into tables reporting mooring configurations and ship motion activity, which are presented in this report. The mooring information is to be used in analyzing and correlating ship motion with prototype wave data collected during the same study period as discussed in Report 1 of this series. Results of wave data analyses and correlations with ship motion will be presented in future reports of this series. (WES)
W75-10664

**SPILLWAY FOR BURNSVILLE DAM, LITTLE KANAWHA RIVER, WEST VIRGINIA; HYDRAULIC MODEL INVESTIGATION,**
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
B. P. Fletcher.
Available from National Technical Information Service, Springfield, Va 22161 as AD/A-008 372, $4.25 in paper copy, $2.25 in microfiche. Technical Report H-75-5, March 1975. 58 p, 10 fig, 2 tab, 9 photo, 19 pl.

Descriptors: *Open channel flow, *Outlet works, *Spillways, *Stilling basins, Hydraulic models, Model studies, *West Virginia, Concretes, Spillway gates.
Identifiers: *Burnsville Lake(WV), Little Kanawha River(WV).

The concrete gravity ogee spillway for the Burnsville Dam will contain three 42-ft-wide gate bays separated by 8-ft-wide piers. Outlet works consisting of five low-level and three water-quality sluices will discharge on the downstream slope of the spillway. A hydraulic-jump type stilling basin will provide satisfactory dissipation of the energy of the spillway and sluice flows. A 1:40-scale model of the spillway, sluices, stilling basin, approach area, and exit channel was used to study the overall hydraulic performance of the structure. Tests indicated that flow conditions in the ap-

proach to the spillway with both uncontrolled and controlled flows were satisfactory for the full range of anticipated discharges. The stilling basin performed satisfactorily for spillway flows, and the only structural modification recommended was the elimination of the wing walls at the end of the basin. Operation of the right water-quality sluice simultaneously with the five low-level sluices resulted in satisfactory stilling basin performance. The size and extent of the stone protection required on the dam embankment, side slopes of the exit channel, Fisherman's Bridge, and Fisherman's Weir were determined by model investigations. (WES)

**TURBULENT FLOW IN RECTANGULAR OUTLET CONDUIT, REND LAKE DAM, BIG MUDDY RIVER, ILLINOIS,**
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
C. A. Pugh.
Available from the National Technical Information Service, Springfield, Va 22161 as AD/A-005 150, $3.75 in paper copy, $2.25 in microfiche. Technical Report H-75-2, January 1975. 33 p, 9 fig, 1 tab, 9 pl, 7 ref.

Descriptors: *Conduits, *Outlet works, *Turbulent flow, *Illinois.
Identifiers: *Rend Lake Dam(Ill), Big Muddy River(Ill).

Tests were conducted in a 4- by 6-ft concrete conduit at Rend Lake Dam, Big Muddy River, Illinois, in September 1973 to investigate turbulent flow characteristics in a rectangular conduit on a full scale and to provide data for future design work. Two cantilevered velocity probes were used to measure horizontal velocity profiles at 6 points along the inlet region. Piezometric head was measured with embedded piezometers at 12 points along the entire length of the conduit. Average velocity of flow in the conduit was 27 ft/sec, and the average Reynolds number was 1.25 x 10 to the 7th power. Velocity distributions in the boundary layer were in good agreement with a log-linear velocity profile equation. The coefficients in the velocity profile equations and the shear stress become constant at X/D approximately equal to 20. Equivalent sand grain roughness values were about the same as those determined by other investigators for circular conduits of comparable size and construction. (WES)
W75-10666

**NAVIGATION CONDITIONS AT CANNELTON LOCKS AND DAM, OHIO RIVER; HYDRAULIC MODEL INVESTIGATION,**
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. J. Franco, and C. D. McKellar.
Available from National Technical Information Service, Springfield, Va 22161 as AD/A009 489, $5.25 in paper copy, $2.25 in microfiche. Technical Report H-75-6, April 1975. 114 p, 3 fig, 9 tab, 6 photo, 55 pl.

Descriptors: *Ohio River, *Locks, *Dams, Powerplants, Flow, Channels, Ice, Discharge(Water), Overflow, Spillways, Gates, *Hydraulic models, Model studies, *Indiana, *Navigation.
Identifiers: *Cannelton Locks and Dam(Ind).

Cannelton Locks and Dam, proposed for construction on the Ohio River, will replace existing Locks and Dams 43-45. The project comprises two locks with clear chamber dimensions of 110 by 600 ft and 110 by 1200 ft and a 1365-ft-long, gated, non-navigable dam, with provisions for powerhouse facilities at the left end of the dam. An undistorted, 1:120-scale model reproducing 8 miles of the Ohio River, the locks and dam structures, the hydropower plant, and other structures that affect flow conditions was used for the investigation. The principal results of this investigation indicate the following: (a) Velocities along the lock side of the channel will tend to be high. (b) Ice and debris will tend to move along the lock side of the river, with the concentration on that side increasing as the river discharge increases. (c) Orientation of the powerhouse and tailrace can affect navigation conditions in the lower lock approach. (d) Satisfactory navigation conditions can be developed over the overflow section between the spillway and powerhouse with some excavation along the left overbank upstream of the powerhouse intake channel. (e) The head on the lower lock gate at the end of lock emptying can be as much as 0.6 ft, depending on velocities along the lock side of the channel. Proposed solutions to these problems are presented. (WES)
W75-10667

**FLOOD CONTROL PROJECT ON LYTLE AND WARM CREEKS AND SANTA ANA RIVER, CALIFORNIA; HYDRAULIC MODEL INVESTIGATION,**
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. H. Ables, Jr., and G. A. Pickering.
Available from the National Technical Information Service, Springfield, Va 22161 as AD/A-009 493, $4.25 in paper copy, $2.25 in microfiche. Technical Report H-75-7, April 1975. 72 p, 13 fig, 3 tab, 17 photo, 21 pl.

Descriptors: *Flood control, *Flood flow, Levees, Streambeds, Energy dissipation, Bridges, *Hydraulic models, Flow, Riprap, Sediment transport, Design flow, *California, Model studies.
Identifiers: Lytle Creek(Cal), Warm Creek(Cal), *Santa Ana River(Cal), San Bernando(Cal), Grade control structures, Concrete channel, Confluences.

The Lytle and Warm Creeks and Santa Ana River project will provide another important unit under the general comprehensive plan for flood control in San Bernardino County, California. The proposed plan for containing the flood flows will consist of raising levees, excavating streambeds, and constructing grade control structures, energy dissipators, bridges, and several thousand feet of high-velocity concrete channel. The investigation was conducted on a 1:60-scale model with the existing and proposed bridges, concrete channels, and natural streambed channels with revetted slopes reproduced in the model. Tests were concerned with flow conditions, water-surface elevations, rip-rap stability, and sediment transport at the grade control structures, bridges, confluences, and energy dissipators. Tests revealed the flow conditions produced by the original design exposed rock energy dissipators in Santa Ana River and Warm Creek were unsatisfactory. Baffle block energy dissipators that were then developed for these areas resulted in satisfactory flow conditions with the design flow. (WES)
W75-10668

**EVALUATION OF DISPOSAL AREAS IN JAMES RIVER; HYDRAULIC MODEL INVESTIGATION,**
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. A. Boland, Jr., and W. H. Bobb.
Available from the National Technical Information Service, Springfield, Va 22161. Miscellaneous Paper H-75-1, January 1975. 39 p, 3 fig, 3 tab, 11 photo.

Descriptors: *Hydraulic models, *Sediment control, *Waste disposal, *Virginia, Model studies, Evaluation, Dredging, Sediments, Water pollution sources.
Identifiers: Dredged material, *James River(VA), Waste disposal sites.

The existing comprehensive fixed-bed model of James River (VA) was used to study the major disposal areas used during maintenance dredging operations for the existing 25-ft-deep navigat channel to determine if the disposal areas are p forming satisfactorily in terms of retain dredged material placed therein. The tests c sisted of the release of lightweight sediment surface depth in the disposal areas, tracing p terns of movement of material from the areas, defining areas where these sediments wo probably deposit. The results indicated that general, the disposal areas and operat procedures presently employed are satisfact with respect to areas of material deposition material retention characteristics. (WES)

**LAKE ERIE INTERNATIONAL JETPO MODEL FEASIBILITY INVESTIGATI( PHYSICAL MODEL FEASIBILITY STUDY,**
Army Engineer Waterways Experiment Stat Vicksburg, Miss.
D. G. Outlaw, D. L. Durham, D. D. Davidson, a R. W. Whalin.
Available from the National Technical Infor tion Service, Springfield, Va 22161 as AD/A 729, $5.25 in paper copy, $2.25 in microfi Technical Report H-74-6, April 1975. 114 p, 21 8 tab, 20 pl, 3 append, 24 ref.

Descriptors: *Hydraulic models, *Feasibility dies, *Lake Erie, *Airports, Breakwat *Waves(Water), Littoral drift, Seiches, Stan waves, *Lakes, *Model studies, *Ohio.
Identifiers: Mass circulation, Wave action, R ing circulation, Cleveland(Ohio).

This report presents the conclusions and rec mendations of the U.S. Army Engineer W ways Experiment Station's study of the feasib of using physical hydraulic models to estimat effects of the proposed Lake Erie Internati Jetport on lake hydrodynamics. The phy models considered in the study are mass cir tion, wave action, breakwater stability, longshore littoral transport models. Spe models are recommended for investigation o modification of wave conditions along the s due to the jetport and for evaluation of breakw stability. However, a specific physical mode investigation for mass circulation is not re mended prior to the completion of a numerica culation study, another task in the model feas ty study. A non-rotating standing wave mod the lake is recommended, again dependent o results of the numerical circulation model, f vestigation of seiche currents near the jetpo small-scale pilot model is recommended t timize construction and operating technique both rotating circulation and standing models. **CURRENT WATER SYSTEMS AUTOMATION RESEARCH AND DEVELOPMENT IN THE BUREAU OF RECLAMATION,**
Bureau of Reclamation, Denver, Colo.
C. A. Calhoun.
In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 353-367, 1974. 2 fig, 6 ref.

Descriptors: *Research and development, *Automatic control, *Hydraulic structures, *Mathematical models, *Hydraulic models, Model studies, Hydraulic similitude, Canals, Channels, Automation, Control structures, Check structures, Floods, Gates, Gate control, Control systems, Mechanical control, Hydraulics.

Research and development of equipment and methods for automating water systems are underway in the Bureau of Reclamation. Mathematical models and laboratory models are valuable tools in this effort. Mathematical models are used to simulate hydraulic and control systems. Laboratory models are used to test hardware by allowing 'hands-on' techniques. Emphasis on open channel applications has resulted in new control equipment. The EL-FLO + Reset Controller is an example of such equipment. This controller uses the proportional plus reset mode of control and appears to have wide application to existing and planned water projects. The program described is focused on a typical canal operation. It is recognized that a canal reach or an entire canal may be only a microsystem of a much larger macrosystem which will include the river basin and ultimately the universe. Cooperation with planners and operators to provide the interface between the microsystems which make up water systems is required. Computer operated controllers appear to have advantages for these interfaces. By placing attention on more than one method of developing controls it is felt that rapid progress can be made in reaching the stated goal of improved service to water users with less waste and at a cheaper cost of operation. Identifiers: *Modesto Irrigation District(Cal).

The Modesto Irrigation District lies in California's fertile San Joaquin Valley between the Sierra Nevada Mountains and the San Joaquin River, 75 miles east of San Francisco. Formed in 1887, water was first delivered in 1904. The Tuolumne River passes through San Francisco's Hetch Hetchy reservoirs and power houses before reaching storage in the reservoir behind Don Pedro Dam, owned and operated by the Modesto Irrigation District and her sister, the Turlock Irrigation District. Complicated main canal operations were anticipated in November 1970 with the changeover to the new Don Pedro Dam. The new 2 million acre-feet reservoir inundated the 40 year old, quarter-million acre-feet reservoir. A program of canal gate modifications was undertaken to accomodate the considerable fluctuations of flow in the transmission portion of the main canal to the Modesto Irrigation District's foothill regulating reservoir. These flows were anticipated due to the increased powerhouse discharge capacity used for generation of peaking power. Described and illus-

trated in this report were the several changes made in control gates, automated gate controls, Level sensors, the gate operating machinery. (See also W75-10769) (Sims-ISWS)

**FLOAT VALVE PROVIDES VARIABLE FLOW RATES AT LOW PRESSURES,**
California Polytechnic State Univ., San Luis Obispo. Dept. of Agricultural Engineering.
J. L. Merriam.
In: Agricultural and Urban Considerations in Irrigation and Drainage; Selected Papers from the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 385-402, 1974. 1 fig, 1 append.

Descriptors: *Irrigation, *Irrigation systems, *Irrigation engineering, *Valves, Flow control, Farm equipment, Hydraulic valves, Regulation, Irrigation practices, Furrow irrigation, Furrow systems, Irrigation design, Operating costs, Equipment, Hydraulics, Engineering, Agricultural engineering, Agriculture.

Semi-closed and closed pipeline systems can provide water delivery that is flexible in rate and duration with 'finger-tip' control at the ultimate point of application. Such delivery is essential for efficient and economical use of water and labor. The water source must be capable of supplying water at variable rates and duration; therefore, an on-farm reservoir is frequently necessary. The extra capital investment to construct such a system is economically justified by reduced annual costs of labor and increased irrigation efficiency. Large capacity systems further increase labor efficiency. Semi-closed systems utilizing a float valve actuated by downstream water levels permit deliveries at low, relatively uniform pressure. Closed systems may develop high pressure on steep or long slopes and have appreciable variation in pressure with changes in flow rates. (See also W75-10769)

**GEOTHERMAL POWER PLANT WITH HIGH EFFICIENCY,**
P. Baciu.
U. S. Patent No 3,875,749, 10 p, 13 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 933, No 2, p 576, April 8, 1975.

Descriptors: *Patents, *Geothermal studies, *Temperature, Heat exchangers, Powerplants, Electric powerplants, Pressure, Carbon dioxide.
Identifiers: Geothermal powerplant.

Provided is a closed-system geothermal power plant operative and maintained at super-critical pressure in the utilization of carbon dioxide as the power fluid used in the cycle for the driving of a super-critical pressure-type gas turbine and associated generator to electricity. The exhaust effluent is still in a gaseous state but as reduced pressure nevertheless still at super-critical pressure and temperature and is passed through heat exchangers and then passed to a super-critical type condenser in which the gaseous carbon dioxide effluent is condensed to a liquid state. The super-critical pressurized carbon dioxide fluid is fed to a heat exchanger in relationship with, but isolated from, carbon dioxide gas effluent from the gas turbine. Thereafter the superheated carbon dioxide super-critical pressurized superheated gas is fed downwardly through layers of rock to subterranean lithosphere and preferably to within basalt volcanic rock plug covern space either naturally or artificially-excavation occurring. The basalt rock covern space is subdivided into upper chamber(s) and lower space-apart chamber(s) segregated from one another by two intermediate preheater chambers which are in communication with upper chamber and the wells extending from the lower portion of preheated chambers to a lower portion of preheated chambers. **CORROSION AND ITS COST IN SEWAGE TREATMENT,**
V. H. Lewin.
Water Pollution Control, Vol 73, No 5, p 548-550, 1974.

Descriptors: *Sewage treatment, *Design criteria, *Construction materials, *Corrosion, Corrosion control, Coating, Paints, Maintenance, *Waste water treatment.
Identifiers: Metal corrosion.

A study was conducted by the Institute of Water Pollution Control (Great Britain) of metal corrosion control in the sewage treatment industry. Goals were to identify major problem areas, to find how local authorities had overcome or attempted to overcome corrosion problems, and to determine the cost of corrosion. Costs were to be broken down into prevention and scheduled maintenance, unscheduled maintenance and repair, and applicable research and development services including consulting. Forty-three sewage works responded to questionnaires. Corrosion is regarded as inevitable and protective measures in the form of paints and coatings vary greatly. Often corrosion is tolerated until it is necessary to replace part or all of the structure; then alternative construction materials may be chosen. Surface treatments should be applied at the time of construction rather than as a later remedial measure for optimal results. However effective the coating, whether it is epoxy resin, paint, chlorinated rubber, or compounds incorporating finely-ground stainless steel, its protection is largely dependent on the thoroughness of surface preparation to clean the bare metal. Costs varied by size, age, and design of the individual sewage treatment plants and no cost generalities could be made from the range of the data. (Prague-FIRL)

## 8H. Rapid Excavation

**PROJECT LOST CREEK: FIELD TESTS O MOUNDING AND CONTROLLED BLASTING,**
Army Engineer Waterways Experiment Statio Livermore, Calif. Explosive Excavation Researc Lab.
C. C. McAneny.
Technical Report E-75-1, January 1975. 122 p, fig, 7 tab, 18 ref, 8 append.

Descriptors: *Excavation, *Rock excavatio *Dam construction, *Spillways, Explosives, E plosions, Hydraulic structures, Engineering, Ci engineering, Dams, Diversion structures, Ro mechanics, Construction, On-site investigations.
Identifiers: *Blasting, Mounding.

A concept of blasting termed 'mounding' involv using relatively compact explosive charges a breaking to the horizontal ground surface. Proje Lost Creek comprised a group of single-char and row-charge blasting experiments designed investigate the concept of mounding. Moundi row design criteria, fragmentation produced mounding charges, and performance of moundi explosives with differing properties were studie as were suitability of mounding for producing ro fill and use of controlled blasting in conjuncti with mounding charges to diminish shock and improve excavation slope control. The Lost Cre experiments were performed in a basaltic andes rock, which showed columnar jointing a netwo of closely spaced irregular fractures. Moundi blasts in this rock produced good fragmentatio such that the material was quite acceptable rock fill. The natural fracture pattern exerted main control on fragment sizes. Of three bulk plosives tested as mounding charges, AN proved to be the most effective, based on to volume of rock broken. A two-lift prototype sp way cut was excavated following blasting w

ing charges. This achievement demon-
that mounding offers a feasible method of
lesign for structural excavations. (Sims-

ers: *Airblast overpressure.

ls of predicting gas-vent and ground-shock-
l airblast overpressure levels from un-
nd explosions have been under investiga-
r many years. In order to obtain an accu-
thod for predicting peak overpressures and
es from large-array-type detonations with
nt delay periods, more data from this type
t must become available. The airblast over-
e measurement program at R.D. BAILEY
l in a large amount of data to be used, first,
nating the airblast expected from future
ions in the R.D. BAILEY spillway area
cond, to provide further input to prediction
studies. A discussion of the instrumenta-
d procedures used to obtain these data fol-
presentation of the results and an analysis
e results. Since peak overpressures from
detonations were caused by several dif-
irblast-producing mechanisms, no definite
ions could be drawn concerning prediction
s. (Sims-ISWS)

TIALITY OF VITAMIN C IN FEEDS FOR
SIVELY FED CAGED CHANNEL CAT-
Univ., Ala. Dept. of Fisheries and Allied
ltures.
ovell.
Vol 103, No 1, p 134-138, 1973. Illus.

tors: *Channel catfish.
ers: Aeromonas-liquefaciens, *Caged cat-
Feeds, Lordosis, Mortality, Pathology,
is, *Vitamin C, Weight.

l catfish fingerlings (1600) were stocked in
ating cages, 400/cage, and fed production-
ets intensively for 180 days. Half the fish
d a diet that was nutritionally sufficient ex-
being low in vitamin C, and the reamining
re fed the same formulation with supple-
vitamin C. At the end of the feeding period,
h was examined for gross signs of vitamin
iency, and fish were sampled for examina-
internal symptoms by X-ray, tissues analy-
histological techniques. Weight gains (g),
nversions (g gain/g feed), survival (%) and
ce of physical deformation (%) for fish fed
th and without supplemental ascorbic acid,
ively, were 531 vs. 331; 1.29 vs. 1.88; 98.0
8; and 3.9 vs. 45.0. Deformities were
ly scoliosis and lordosis with depigmented
n backs. Vitamin C deficiency resulted in
mortality from pathogenic bacteria
onas liquefaciens) infestation. Differences
nse to the 2 diets did not become apparent
ter the fish had grown satisfactorily for at
wk or weighed 100-180 g. Dietary supple-
on of vitamin C was reflected in blood,
d anterior kidney contents of ascorbic acid
but not in condition of gill filaments or opercula.--

THE LOWER COLORADO RIVER: A BIBLIOGRAPHY,
Arizona Western Coll., Yuma.
R. Yates, and M. Marshall.
Arizona Western College Press, Yuma, 1974. 153 p.

Descriptors: *Bibliographies, *Colorado River, *Mexican Water Treaty, *History, *Political aspects, Saline water, Indian reservations.

Over fourteen hundred entries dealing primarily or in part with the lower Colorado River are identified. While there is some emphasis on historical records, including early exploration and settlement, the military, and stream navigation, the main attention is on the Colorado Delta, Mexico and the Colorado River, the politics of water, reclamation, mining, and urbanization. The physiography of the Colorado is of increasing importance, and these bibliographical references to its dams, reclamation and irrigation projects, and salinity problems are a useful backup for technical and lay persons. Author and subject indexes are provided. (Paylore-Arizona)

5-10511 2E

ISTICS
istical Tolerance Limits for a Pearson Type Distribution,
5-10511 2E

Model of Statistical Errors in Estimating amflow from Continuous-Stage Records,
5-10512 2E

LHEAD TROUT
te Toxicity of Kanamycin to Steelhead ut (Salmo Gairdneri),
5-10423 5C

STEROIDS
Corticosteroid Concentrations in Sockeye Salmon (Oncorhynchus Nerka) Exposed to Low Concentrations of Copper,
W75-10415 5C

STILLING BASINS
Spillway for Burnsville Dam, Little Kanawha River, West Virginia; Hydraulic Model Investigation,
W75-10665 8B

STOCHASTIC PROCESSES
Proceedings Symposium on Statistical Hydrology.
W75-10507 2A

Stochastic Generation of the Occurrence, Pattern, and Location of Maximum Amount of Daily Rainfall,
W75-10516 2B

A Stochastic Model for Daily Rainfall Data Synthesis,
W75-10518 2B

Stochastic Model of Daily Rainfall,
W75-10520 2B

An Event-Based Stochastic Model of Areal Rainfall and Runoff,
W75-10521 2B

Research in Stochastic Models for Bedload Transport,
W75-10522 2J

A Stochastic Model of Sediment Yield for Ephemeral Streams,
W75-10524 2J

STOMATA
An Analysis of the Mechanics of Guard Cell Motion,
W75-10488 2I

STORM RUNOFF
Flood Waves and Suspended Sediment Pulses in Urbanized Catchments,
W75-10647 4C

STORM WATER
Coping With Urban Runoff in the United States,
W75-10541 5D

STRAW MAN
Panel Review of the Taxonomic Structure of the Straw Man.
W75-10806 6B

Panel Evaluation of the Logical Structure, Consistency, and Underlying Assumptions of the 'Strawman' Methodology.
W75-10807 6B

Methodological Application of the Straw Man Decision Structure to a Hypothetical Case: The Dorfman-Jacoby Water Quality Model,
W75-10811 6A

Social Indicators and Connectives,
W75-10812 6A

Towards a Sharper Concept of an Action Variable,
W75-10813 6A

Methodological Problems in Applying the Straw Man to Real Life Problems,
W75-10814 6A

Qualitative Sign Matrix Manipulation,
W75-10815 6A

Necessary Adaptations for Significant Utilization of the Information System,
W75-10816 6A

A Method of Disaggregation,
W75-10817 6A

Algorithmic Modeling and the Straw Man,
W75-10820 6A

STRAW MAN MODEL
Proceedings of the Graduate Student Symposium of the Technical Committee of the Water Resources Centers of the Thirteen Western States.
W75-10810 6A

STREAM ENRICHMENT
An Investigation of the Ecology and Water Quality of a Lake Outlet,
W75-10724 5C

STREAM GAGES
A Criterion for Vegetation Stiffness,
W75-10782 4A

STREAMFLOW
Multisite Streamflow Simulation of Truckee River, Nevada,
W75-10509 2E

A Model of Statistical Errors in Estimating Streamflow from Continuous-Stage Records,
W75-10512 2E

Statistical Inference on Streamflow Processes with Markovian Characteristics,
W75-10525 2E

Recurrence Intervals of Annual Minimum Streamflows,
W75-10530 2E

A Comparison of Methods for Estimating Flood Peaks on Streams in Massachusetts,
W75-10587 4A

Report on the River Master of the Delaware River for the Period December 1, 1973-November 30, 1974,
W75-10589 4A

Index to Water Resources Data for Louisiana: Surface Water Records; Water-Quality Records.
W75-10590 5A

Low-Flow Characteristics of Mississippi Streams,
W75-10605 2E

A Criterion for Vegetation Stiffness,
W75-10782 4A

Effects of Surface Drainage on Stream Flow,
W75-10794 4A

STREAMS
The Loxahatchee - A River in Distress, Southeast Florida,
W75-10588 4C

Temperatures of Wyoming Streams,
W75-10604 7C

STRESS
Decrease of Net Carbon Flux in Two Species of Mussels Caused by Extracts of Crude Oil,
W75-10433 5C

STRESS ANALYSIS
Pipeline Stress Analysis,
W75-10824 8B

STRUCTURES
Avalanche Protection in Switzerland.
W75-10656 8C

SUBLETHAL CONCENTRATIONS
Uptake, Elimination and Biotransformation of the Lampricide 3-Trifluromethyl-4-Nitrophenol (TFM) by Larvae of the Aquatic Midge Chironomus Tentans,
W75-10629 5C

SUBLETHAL EFFECTS
Corticosteroid Concentrations in Sockeye Salmon (Oncorhynchus Nerka) Exposed to Low Concentrations of Copper,
W75-10415 5C

The Effects of Crude Oil on the Palatability of Marine Crustaceans,
W75-10428 5C

Toxicity of the Lampricide 3-Trifluoromethyl-4-nitrophenol (TFM) to 10 Species of Algae,
W75-10697 5C

Toxicity and Residue Dynamics of the Lampricide 3-Trifluoro-Methyl-4-Nitrophenol (TFM) in Aquatic Invertebrates,
W75-10700 5C

SUBLIMATION
Estimating the Transport and Evaporation of Blowing Snow,
W75-10695 2C

SUCCINIC ACID MONO-SULPHO-ESTER
Effect of a Mixture of Succinic Acid Mono-Sulpho-Ester and Olefin Sulfonate on Fish (Uber die Wirkung einer Mischung von Sulfobernsteinsaure-halbester und Olefinsulfonat auf Fische),
W75-10409 5C

SUGAR BEETS
Effect of a Phytoplankton Culture on the Germination and Seedling Development of Barley, Sugar Beets and Lettuce,
W75-10496 3F

SULFATES
Absorption, Metabolism, and Excretion by Goldfish of the Anionic Detergent Sodium Lauryl Sulphate,
W75-10626 5C

The Mutual Destruction of Polluting Factors in Waste Liquors,
W75-10645 5D

SULFITE LIQUORS
Studies on Possibilities of Biochemical Purification of Evaporator Condensate Occurring During Sulfite Pulp Manufacture (Untersuchungen ueber die Moeglichkeit der biochemischen Reinigung des bei der Sulfitzellstoffherstellung anfallenden Eindampfkondensates),
W75-10382 5D

How to Purify Effluents, Recover Byproducts With Reverse Osmosis,
W75-10391 5F

SULFUR BACTERIA
The Mutual Destruction of Polluting Factors in Waste Liquors,
W75-10645 5D

SULFUR COMPOUNDS
Effect of a Mixture of Succinic Acid Mono-Sulpho-Ester and Olefin Sulfonate on Fish (Uber die Wirkung einer Mischung von Sulfobernsteinsaure-halbester und Olefinsulfonat auf Fische),
W75-10409 5C

SUNFISHES
Uptake of Three Polychlorinated Biphenyls, DDT and DDE by the Green Sunfish, Lepomis Cyanellus Raf.,
W75-10422 5C

Effects of pH on Toxicity of Antimycin to Fish,
W75-10450 5C

SUPPLY
A Connectives Model Relating Water Policy Action Variables to Recreational Opportunity Social Indicators,
W75-10819 6A

SURFACE WATER AVAILABILITY
Hydrologic Reconnaissance of the Southern Uinta Basin, Utah and Colorado,
W75-10585 3B

SURVEYS
Channel Erosion Surveys Along Southern Segment of the Taps Route, Alaska, 1972 and 1973,
W75-10594 8B

SUSPENDED SEDIMENTS
Total Sediment Load by the Extrapolated Data Procedure,
W75-10847 2J

SUSPENDED SOLIDS
Analysis of Alternatives for Removal of Suspended Solids in Pulp and Paper Mill Effluents,
W75-10400 5D

SUSQUEHANNA RIVER (PA)
Flood Plain Information: Bloomsburg, Columbia County, Pennsylvania-Susquehanna River.
W75-10561 4A

Flood Plain Information: West Branch Susquehanna River, Lycoming County, Pennsylvania.
W75-10576 4A

SWAMPS
Hydrology of the Albemarle-Pamlico Region, North Carolina--A Preliminary Report on the Impact of Agricultural Developments,
W75-10602 4C

SWANNANOA RIVER
A Precipitation Data Simulator Using a Second Order Autoregressive Scheme,
W75-10513 2B

SWEDEN
Stockholm Puts Sewage Plants Underground,
W75-10718 5D

SWIMMING
Swimming Performance of Juvenile Coho Salmon (Oncorhynchus Kisutch) Exposed to Bleached Kraft Pulp Mill Effluent,
W75-10387 5C

SWITZERLAND
Avalanche Protection in Switzerland.
W75-10656 8C

SYNERGISTIC EFFECTS
Toxicity of Paired Mixtures of Candidate Forest Insecticides to Rainbow Trout,
W75-10439 5C

Acute Toxicities of 3-Trifluoromethyl-4-Nitrophenol (TFM) and 2',5-Dichloro-4'-Nitrosalicylanilide (Bayer 73) to Larvae of the Midge (Chironomus Tentans),
W75-10698 5C

SYNTHESIS
A Stochastic Model for Daily Rainfall Data Synthesis,
W75-10518 2B

SYSTEMATICS
Fishes of the Hiwassee River System: Ecological and Taxonomic Considerations,
W75-10694 5C

SYSTEMS ANALYSIS
Analysis of a Large Water Distribution System Using Advanced Computer Software,
W75-10720 4A

TAIWAN
Effects of Heavy Metals and Pesticides on the Mass Mortalities of Cultured Shellfishes Along the Southwest Coast of Taiwan, (In Chinese),
W75-10427 5C

TAMPA BAY AREA (FLA)
New Concepts in Suburban Drainage in Florida,
W75-10793 4A

TAMPA BAY (FLA)
Additional Studies of the Fishes, Macroinvertebrates and Hydrological Conditions of Upland Canals in Tampa Bay, Florida,
W75-10617 5C

TAPS ROUTE (ALASKA)
Channel Erosion Surveys Along Southern Segment of the Taps Route, Alaska, 1972 and 1973,
W75-10594 8B

TAR POLLUTION
Tar Pollution of Sierra Leone Beaches,
W75-10472 5B

TELEOSTS
DDT : Short Term Effects on Osmoregulation in Black Surfperch (Embiotoca Jacksoni),
W75-10429 5C

TEMPERATURE
Critical Thermal Maxima of Three Species of Hawaiian Estuarine Fish: A Comparative Study,
W75-10426 5A

Bioassay Data for Marine Pollution Using Sea Urchin Eggs, 1972 and 1973,
W75-10432 5A

The Effect of Temperature and Salinity on Cadmium Uptake by the Blue Crab, Callinectes sapidus,
W75-10448 5B

A Climatological Analysis of North Polar Desert Areas,
W75-10455 2C

Daily Temperature and Salinity of Surface Water of Patuxent River at Solomons, Maryland, Based on 30 Years of Records (1937-1967),
W75-10535 2L

Analog Temperature Records from Linearized Thermistor Network,
W75-10650 7B

eothermal Channel and Harbor Ice Control ystem,
'75-10734 4A

eothermal Power Plant with High Efficiency,

THALLIUM
Thallium: Occurrence in the Environment and Toxicity to Fish,
W75-10449 5C

THAWING
Geothermal Channel and Harbor Ice Control System,
W75-10734 4A

THEORETICAL ANALYSIS
Derived Decision Rules for Pollution Control in a General Equilibrium Space Economy,
W75-10360 6C

THERMAL POLLUTION
Influence of a Thermal Effluent on Movement of Brown Bullhead (Ictalurus Nebulosus) as Determined by Ultrasonic Tracking,
W75-10628 5C

The Effect of Prolonged Exposure to Elevated Temperatures on the Biochemical Constituents, Gonadal Development and Shell Deposition of the American Oyster, Crassostrea Virginica,
W75-10849 5C

THERMOMETER
Analog Temperature Records from a Linearized Thermistor Network,
W75-10650 7B

THERMOPHILIC BACTERIA
Production of Microbial Protein From Waste Cellulose by Thermomonospora Fusca, A Thermophilic Actinomycete,
W75-10538 5C

THUNDERSTORMS
Stochastic Models of Spatial and Temporal Distribution of Thunderstorm Rainfall,
W75-10519 2B

TIDAL CURRENTS
Norton Point Dike Study, Coney Island, New York; Hydraulic Model Investigation,
W75-10662 8B

TIGRIOPUS CALIFORNICUS
The Effect of Crude Oil Fractions on the Survival of a Tidepool Copepod, Tigriopus Californicus,
W75-10641 5C

TILE DRAINAGE
Art of Agricultural Drainage Design and Costs,
W75-10797 4A

TILL
Glacier-Flow Patterns and the Origin of Late Wisconsinan Till in the Southern Rocky Mountain Trench, British Columbia,
W75-10539 2C

TIMBER YIELD
Simulating Timber Yields and Hydrologic Impacts Resulting From Timber Harvest on Subalpine Watersheds,
W75-10406 3B

TIME SERIES ANALYSIS
Removal of Periodicities by Differencing and Monthyl Mean Subtraction,
W75-10352 2A

TIN
Fast Separation of Tin (IV) From Tin (II) and From Numerous Metal Ions on Ion-Exchange Papers,
W75-10497 2K

TOKYO BAY
PCBS in the Spotted Sharks, Mustelus Manazo, From Tokyo Bay, (In Japanese),
W75-10622 5A

TOXAPHENE
Toxaphene Effects on Growth and Development of Brook Trout (Salvelinus Fontinalis),
W75-10621 5C

TOXICITY
Toxicity of Pulping Wastes to Fish,
W75-10403 5C

Effect of a Mixture of Succinic Acid Mono-Sulpho-Ester and Olefin Sulfonate on Fish (Uber die Wirkung einer Mischung von Sulfobernsteinsaure-halbester und Olefinsulfonat auf Fische),
W75-10409 5C

Toxic Effects of Aliphatic Chlorinated by-Products from Vinyl Chloride Production on Marine Animals,
W75-10412 5C

Toxicity of Phosphamidon to American Lobsters (Homarus Americanus) Held at 4 and 12C,
W75-10413 5C

Acute Toxicity of Kanamycin to Steelhead Trout (Salmo Gairdneri),
W75-10423 5C

DDT : Short Term Effects on Osmoregulation in Black Surfperch (Embiotoca Jacksoni),
W75-10429 5C

Temperature-Induced Changes in Acute Toxicity of Zinc to Atlantic Salmon (Salmo salar),
W75-10431 5C

Toxic Effects of an Anionic Detergent on the Gills of Rainbow Trout,
W75-10434 5C

**TOXICITY**

The Effects of a No. 2 Fuel Oil and Two Crude Oils on the Growth and Photosynthesis of Microalgae,
W75-10436 5C

Toxicity of Two Synthetic Pyrethrins to Brown Trout,
W75-10438 5C

Toxicity of Paired Mixtures of Candidate Forest Insecticides to Rainbow Trout,

## CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

**Supported by the Environmental Protection Agency in cooperation with WRSIC**

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

## Subject Fields

NATURE OF WATER

WATER CYCLE

WATER SUPPLY AUGMENTATION AND CONSERVATION

WATER QUANTITY MANAGEMENT AND CONTROL

WATER QUALITY MANAGEMENT AND PROTECTION

WATER RESOURCES PLANNING

RESOURCES DATA

ENGINEERING WORKS

MANPOWER, GRANTS, AND FACILITIES

SCIENTIFIC AND TECHNICAL INFORMATION

# SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
DEC 1 - 1975
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 8, NUMBER 22
NOVEMBER 15, 1975

75-10851 -- W75-11350
ODEN. SWRABW

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

# FOREWORD

**Selected Water Resources Abstracts,** a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

**Selected Water Resources Abstracts** is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

**01** NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

**02** WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

**03** WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

**04** WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

**05** WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

**06** WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

**07** RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

**08** ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

**09** MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

**10** SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

essays explored consequences of human in-
nce with the hydrological cycle. Man's ef-
o control the world's water cycle involves
other than hydrology and engineering;
ical, sociological, economic, cultural, and
l considerations and forces must also be
into account. The first paper explains the
gical cycle of the waters of the earth. A
ng section details human impact on the
gical cycle and finds this impact increas-
gative; pollution of water and air, saliniza-
irrigation districts, mining of groundwater
lands, and potential threats to the stability
hydrologic regime which to date has
d human life. The book concludes with an
tion of man's greatest obstacle in realizing
rologic dreams: man. Examples of interna-
d national failures in planning and execut-
r projects and the prospects presented by
pollution and population are discussed.

**BALANCING THE EFFECTS OF MAN'S ACTIONS ON THE HYDROLOGICAL CYCLE,**
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
A. B. Costin, and J. C. I. Dooge.
In: Man's Influence on the Hydrological Cycle, Food and Agriculture Organization of the United Nations, Rome, Irrigation and Drainage Paper Special Issue No 17, p 19-51, 1973. 2 fig, 64 ref.

Descriptors: *Hydrologic cycle, *Hydrologic aspects, *Land use, *Urbanization, *Water management(Applied), Topography, Water storage, Surface runoff, Soil erosion, Surface waters, Soil water, Evapotranspiration, Percolation, Weather modification, Evaporation control, Transpiration control, Irrigation, Saline water, Drainage practices, Desalination, Forestry, Water pollution.
Identifiers: Moisture interception, Thames River, Mekong River.

Water, the most manageable of the natural resources, is capable of diversion, transport, storage and recycling. However, great care must be taken in developing one aspect of the hydrological cycle so that other hydrologic components are not adversely affected. Hydrological changes resulting from land use practices are discussed, showing how readily terrain alterations affect precipitation, surface, and sub-surface waters. Man's attempts to control hydrological processes by weather modification, evaporation and transpiration controls, control of soil water movement, engineering techniques to increase availability, and irrigation and drainage often have considerable side effects. Natural hydrologic processes can be greatly upset by practices which seem superficially beneficial, including desalination, forestry practices and urbanization. Examples of pollution effects are presented for the Thames and Mekong Rivers. The need for logical decisions in water management is vital and any alteration of one hydrological component must take into consideration all others. (See also W75-10863) (Michael-Arizona)

**HUMAN OBSTACLES TO THE CONTROL OF THE HYDROLOGICAL CYCLE FOR THE BENEFIT OF MAN,**
Technion - Israel Inst. of Tech. Haifa (Israel). Dept. of Agricultural Engineering.
H. Finkel.
In: Man's Influence on the Hydrological Cycle, Food and Agriculture Organization of the United Nations, Rome, Irrigation and Drainage Paper Special Issue No 17, p 53-69, 1973.

Descriptors: *Hydrologic cycle, *Administrative decisions, *Water law, *Legislation, *Water resources development, Legal aspects, Water allocation(Policy), Water rights, Water policy, Water management(Applied), Government.

Many of the world's hydrological problems are due to inefficient and ineffectual management of development projects. Political, historic and nationalistic factors often weigh heavily on development decisions. Many world wide hydrological problems result from inadequate international legislation and enforcement. On a national level, conflicts often arise between urban, industrial and agricultural interests. Economic and financial troubles internationally and locally often limit water development projects. The central problem of hydrological development is population increase. Due to the annual population growth rates in developing countries, hydrological development programs are often obsolete before completed. Effective planning of hydrological resource development must overcome grave human obstacles including data gaps and education, training, and ability deficits in developing countries (See also W75-10863) (Michael-Arizona)

**GENERATION OF ARID ZONE RAINFALL AND RUNOFF,**
University of New England, Armidale (Australia). School of Natural Resources.
I. H. Fisher.
In: Hydrology Symposium, Armidale, Australia, 1975. The Institution of Engineers Australia, Preprints of Papers, p 90 - 94, May 1975. 2 fig, 1 tab, 17 ref.

Descriptors: *Rainfall-runoff relationships, *Synthetic hydrology, *Pasture management, *Arid lands, *Australia, Computer models, Grazing, Water balance.

In an investigation of optimal management policies for livestock grazing a large paddock in arid southern Australia, a model using synthetic daily rainfall input was required to simulate runoff from, and the wide variation of soil moisture in, the paddock. Some problems associated with the

development of such a model are outlined. A statistical analysis of historical rainfall is presented which supports the separation of the generation of the occurrence of wet and dry days from the determination of the magnitude of the nonzero daily rainfalls when constructing synthetic traces. Modifications made to an existing model to include only those processes important in arid conditions are discussed. Also described is a method devised to allow for horizontal transfer of runoff within a paddock between subdivisions relating to factors of importance to both water balance and grazing management policies. Descriptors: *Precipitation(Atmospheric), *Storms, *Colorado, Data collections, Spatial distribution, Temporal distributions, Seasonal, Thunderstorms, Distribution patterns.

The precipitation trend in Colorado was studied statistically using 56 years of data collected at 61 stations. The precipitation had an annual decrease of 0.01 inches over the 56 year period although this result was not statistically significant. Precipitation periods (referred to as storms) were used to describe the variation of the precipitation in space and time. The state of Colorado was divided into six geographic regions, and area weighted hourly precipitation data were summed to obtain the volume of water yielded by each storm. It was found that 80% of the annual volume is produced by 30% of the storms. The western third of the state shows no marked seasonal variation in precipitation, but its southern half receives more precipitation than its northern half. The middle third of the state receives 60% of its precipitation in the summer, and the eastern part, the high plains, receives 80% during the summer months. Thunderstorms predominate during the summer, large scale storms in the winter. The summer precipitation volume is correlated with the annual volume in all regions. After categorizing the storms by their precipitation volume, it was found that wetter years contain more storm events of all sizes than the driest years with no noticeable change in the distribution of the size of the storms. **CONDENSATION IN JETS, INDUSTRIAL PLUMES AND COOLING TOWER PLUMES,**
Waterloo Univ. (Ontario). Dept. of Mechanical Engineering.
T. M. I. Wigley
Journal of Applied Meteorology, Vol 14, No 1, p 78-86, February 1975. 7 fig, 3 tab, 15 ref, append

Descriptors: *Condensation, *Jets, *Cooling towers, *Saturation, Buoyancy, Drops(Fluids), Supersaturation, Humidity, Precipitation(Atmospheric), Temperature, Pressure, Environment, Fallout, Equations, Mathematical studies.
Identifiers: Cooling tower plumes, Industrial plumes.

The one-dimensional theory for the condensation of buoyant plumes was extended to include supersaturation as an extra variable. An additional equation describing the dynamics of droplet growth was used to make the system tractable. Some simple mathematical results were obtained which allowed the theory to be related to, and so extended, a commonly used graphical representation of the condensation process. The theory was then simplified to a single nonlinear first-order differential equation for the condensed water content. This was solved numerically for a typical jet, scrubbed industrial plume, and natural-draft cooling tower plume to obtain down-plume profiles of condensed water content, supersaturation, and mean droplet size. High supersaturation was predicted in all three cases, corresponding to mean relative humidities of up to 170% (jet), 150% (scrubbed plume), and 105% (cooling tower). These results may be important in predicting the growth of 'foreign' carry-over droplets in plumes from industrial sources or cooling towers. Predictions of plume length in these cases was found to be insensitive to supersaturation, but plume length was noticeably affected by supersaturation in the case of a jet. In the examples considered maximum mean droplet radii never exceeded 10 micrometers which supports the belief that rainout is caused primarily by carry-over from imperfect mist eliminators. (Jones-ISWS)

**CHARGED DROPLET COLLISION EFFICIENCY MEASUREMENTS,**
National Center for Atmospheric Research, Boulder, Colo.
C. E. Abbott.
Journal of Applied Meteorology, Vol 14, No 1, p 87-90, February 1975. 4 fig, 1 tab, 10 ref.

Descriptors: *Drops(Fluids), *Laboratory tests, *Cloud physics, Efficiencies, Measurement, Photography, Instrumentation, Evaluation, Analytical techniques.
Identifiers: *Collision efficiencies, Charged droplets, Electrostatics.

Experimental measurements were presented for collision efficiencies of highly charged droplets. The drop sizes studied ranged in radius from 10 to 25 micrometers and carry charges of the order of 10 to the -4th power esu. Measured collision efficiencies greater than 100 agreed well with those predicted by Paluch's analytical solution for collision efficiency upper limit. For smaller values, the collision efficiencies predicted from Davis and from Davis and Sartor exceeded those measured. (Jones-ISWS)

## 2D. Evaporation and Transpiration

EVAPOTRANSPIRATION OF FOUR FOREST TYPES MEASURED WITH THE EDDY CORRELATION TECHNIQUE,
Washington Univ., Seattle. Coll. of Forest Resources.
L. J. Fritschen, H. R. Holbo, and M. O. Smith.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 695, $3.75 in paper copy, $2.25 in microfiche. Completion Report, June 24, 1975. 24 p, 7 fig, 2 tab, 9 ref. OWRT A-061-WASH(1). 14-31-0001-4048.

Descriptors: Eddies, Instrumentation, Measurement, Canopy, *Evapotranspiration, *Forests, Meteorology, Design, Analytical techniques.
Identifiers: *Eddy correlation technique, Forest canopies, Sensible heat flux, Spectral analysis, Fluxation.

Eddy correlation instrumentation for evapotranspiration estimation from forest canopies has been evaluated. The frequency response of the Gill-type propeller is probably adequate for obtaining vertical windspeeds, but fine glass-bead thermistors are not fast enough to capture the temperature fluctuations. A fluxatron for the direct assessment of the sensible heat flux was designed and built. In comparison with covariance and cospectral computations made from high frequency data, the fluxatron exhibited a good potential for independently forming and outputing flux estimates. Spectral analyses of the turbulence above the canopy show a wide range of frequencies, extending much lower in frequency than those normally reported. As a consequence, the bandwidth of the fluxatron must be increased. Due to the short wavelength of some of the turbulence, it will also be necessary to mount the anemometer and the thermometer as close together as practicable.

THE MEASUREMENT AND ESTIMATION OF LAKE EVAPORATION FROM FOUR AUSTRALIAN WATER STORAGES,
Bureau of Meteorology, Melbourne (Australia).
E. D. Hoy, and S. K. Stephens.
In: Hydrology Symposium, Armidale, Australia, 1975. The Institution of Engineers Australia, Preprints of Papers, p 70-74, May 1975. 4 fig, 3 tab, 9 ref.

Descriptors: *Evaporation, *Lakes, *Estimating, Water loss, Reservoirs, Measurement, Heat balance, Evaporation pans, *Australia, Data collections.
Identifiers: Lake Eucumbene(NSW), Cataract Reservoir(NSW), Manton Reservoir(NT), Mundaring Reservoir(WA).

Estimates of lake evaporation by the bulk aerodynamic method and the pan conversion method have been evaluated relative to the heat budget method at four Australian lakes. The results for Lake Eucumbene, Cataract Reservoir and Mundaring Reservoir gave standard errors of estimate of 10% in monthly totals of lake evaporation calculated from both methods. At Manton Reservoir only the bulk aerodynamic method has been shown to estimate monthly lake evaporation totals with a standard error estimate of 10%. Monthly totals of pan evaporation and lake evaporation are presented for all lakes. (CSIRO)

Agricultural Research Service, Athens, Ga. Southeast Watershed Research Center.
P. Yates, and W. M. Snyder.
Water Resources Research, Vol 11, No 3, p 418-422, June 1975. 13 fig, 2 tab, 11 ref.

Descriptors: *Recession curves, *Hydrographs, *Streamflow, *Base flow, *Methodology, Optimization, Hydrologic data, Model studies, Watersheds(Basins), Groundwater.
Identifiers: *Convolution method, *Ahoskie Creek(NC).

Streamflow during recessions, that is, during periods of little or no rain, represents a dependable minimum supply of water. However, quantitative mathematical expressions are still lacking for predicting flow during recession periods. A convolutional model of streamflow recession was formulated and tested utilizing sequential values of mean daily discharge, Parameters of the model were determined by optimization wity historical streamflow records. Preliminary relationships of parameters to rate of flow and size of drainage area were explored. (Singh-ISWS)

STREAMFLOW IN THE NEW YORK PART OF THE SUSQUEHANNA RIVER BASIN,
Geological Survey, Albany, N.Y.
H. F. H. Ku, A. D. Randall, and R. D. MacNish.
New York State Department of Environmental Conservation, Albany, Bulletin 71, 1975. 130 p, 31 fig, 10 tab, 60 ref, 4 append.

Descriptors: *Streamflow, *Hydrologic data, *New York, *Watershed management, Evaluation, Runoff, Discharge(Water), Flow duration, Flood frequency, Droughts, Water quality, Water utilization, Water demand, Correlation analysis.
Identifiers: *Susquehanna River basin(NY), Streamflow summary.

The Susquehanna River basin occupies about 6,500 square miles in south-central New York. Continuous records of streamflow at 60 gaging stations are summarized by tables of flow duration and low-flow frequency for the 1931-60 standard period and (or) for periods of record through 1959 and 1967. Similar statistics are developed by correlation for 110 partial-record stations. Record low flows for one or more periods were set at 26 of 37 long-term gaging stations during the drought of the 1960's, and the cumulative runoff deficiency equaled 1-1/2 years of normal runoff. Maps of annual precipitation and runoff show that precipitation is several inches greater in the eastern part of the basin than in the western part, but evapotranspiration is slightly greater in the west. Requirements for within-year and carryover storage with 2- to 10-percent risks of deficiency are presented for gaged sites and may be estimated for ungaged sites from low-flow and mean-runoff parameters. Flood magnitude and frequency at gaging stations are summarized, and three regions are defined within which floods on major streams have a consistent relation to basin size. (Woodard-USGS)

TEMPERATURES OF KANSAS STREAMS,
Geological Survey, Lawrence, Kans.
C. V. Burns.
Kansas Water Resources Board, Topeka, Streamflow Characteristics Technical Report No 12, July 1975. 220 p.

Descriptors: *Water temperature, *Streams, *Kansas, *Basic data collections, Gaging stations, Sites, Streamflow, Discharge(Water), Hydrologic data, Correlation analysis.
Identifiers: *Water temperature frequency distribution, Discharge frequency distribution, Average temperatures, Maximum temperatures, Minimum temperatures.

Water temperature observations in Kansas, made in conjunction with discharge measurements, are presented for the period of record beginning with three stations in 1948 and increasing to about 240 stations by 1972. Water temperature data for each station are summarized both monthly and for the period of record giving the mean, standard deviation, range between maximum and minimum, and number of observations. Graphs show the frequency distributions of time of observation, discharge, and temperature. A plot of temperature versus data illustrates the distribution of all observed data available during 1948-72. (Woodard-USGS)

LOW-FLOW CHARACTERISTICS OF SELECTED STREAMS IN NORTHEASTERN WASHINGTON,
Geological Survey, Tacoma, Wash.
D. E. LaFrance.
Open-file report, 1975. 22 p, 6 fig, 1 plate, 4 tab, 7 ref.

Descriptors: *Washington, *Low flow, *Streamflow, Analytical techniques, Regression analysis, Average flow, Low flow frequency, Gaging stations, Data collections, Hydrologic data, Correlation analysis, Hydrographs, Maps, Sites, Precipitation(Atmospheric), Water utilization, Watershed management, Water demand.
Identifiers: 7-day flows.

Low-flow-frequency curves developed from streamflow records at nine continuous-recording gaging stations in northeast Washington were used to determine discharges for low-flow frequencies of 7, 30, 60, 90, and 183 days. Computed for the nine gaging stations and tabulated in the report are low-flow-frequency data for the 7-day low flows and monthly average low flows at the 2-year recurrence interval. Regression techniques used to estimate the 7-day low flows at 103 miscellaneous short-term sites indicate that correlation coefficients for all except three sites equaled or exceeded 0.90. Low flows varied widely from year to year, as indicated by slope indexes ranging from 1.16 to 8.16 among the 103 miscellaneous sites. The 7-day low flow of the Colville River at Kettle Falls during the periods 1924-32 and 1934-71 ranged from a minimum of 5.29 cfs in 1931 to a maximum of 128 cfs in 1949. (Woodard-USGS)

ESTIMATED MEAN-MONTHLY AND ANNUAL RUNOFF AT SELECTED SITES IN THE POJOAQUE RIVER DRAINAGE BASIN, SANTA FE COUNTY, NEW MEXICO,
Geological Survey, Albuquerque, N. Mex.
L. J. Reiland.
Open-file report 74-150, June 1975. 21 p, 1 fig, 3 tab, 6 ref.

Descriptors: *Streamflow, *Natural flow, *Average flow, *Regression analysis, *New Mexico, Natural streams, Estimating, Runoff, Correlation analysis, Gaging stations, Hydrologic data, Methodology.
Identifiers: *Santa Fe County(N Mex), Ungaged streams.

Estimates are shown for natural mean-monthly and annual runoff at 6 selected sites in the Pojoaque River drainage basin, Santa Fe County, N. Mex. Natural runoff is defined as the runoff that would occur if there were no manmade changes. The sites are: Rio Nambe at Nambe Falls, near Nambe; Rio Nambe near Nambe, plus Nambe canal; Rio En Medio at Nambe Pueblo boundary; Rio Chupadero at Nambe Pueblo boundary; Rio Tesuque at Tesuque Pueblo boundary; and Pojoaque River at mouth. Techniques of regression analysis and runoff-elevation relationships were used to estimate runoff where no streamflow records or only short-term records are available. Comparison of estimated mean-annual runoff, using these techniques, with mean-annual runoff obtained from streamflow records at gaged stations within and near the area indicated that the estimated mean-annual runoff at sites unaffected by excessive channel loss was generally within 10 percent, or less, of the gaged runoff. The natural runoff calculated for each of the six sites is believed to be equivalent to runoff for the water years 1920-1968. (Woodard-USGS)

DERIVATION OF SURFACE WATER LAG TIME FOR CONVERGING OVERLAND FLOW,
New Mexico Inst. of Mining and Technology, Socorro.
V. P. Singh.
Water Resources Bulletin, Vol 11, No 3, p 501-513, June 1975. 2 fig, 5 ref.

Descriptors: *Time lag, *Overland flow, *Mathematical studies, Basins, *Rainfall intensity, Mannings equation, Chezy equation, Momentum equation, Theoretical analysis, Surface waters, Watersheds(Basins), Hydrodynamics, *Watersheds(Basins).
Identifiers: *Kinematic wave theory, Converging overland flow.

Lag time was defined as the lapse between the time of occurrence of 50% input and 50% output. Generalized and special forms of explicit analytical solutions of surface water lag time were derived for converging overland flow, utilizing the kinematic wave theory which comprises equations of continuity and motion. These solutions relate lag time to physically measurable quantities of the watershed, including surface roughness and geometrical parameters. Expressions for lag time were derived both from Manning's and Chezy equations. Hydrologically similar basins exhibit similar lag time behavior. A similarity factor is defined for comparing basins. nce gained in the Northern Territory
uestions are raised concerning the
blishment and operation of a stream gauging network which is most likely to produce information useful to the engineer. It is argued that the common view of hydrologic networks as simple sums of men, machinery and physical phenomena is to be abandoned in favor of a systems approach to obtaining data from the hydrometeorologic system. Attention is drawn to the peculiarities of the Australian arid zone and especially to the need to use non-specialists in many tasks and the need to perform hydrologic calculations as the ultimate check of the value of hydrographic data. **VARIABILITY, PERSISTENCE AND YIELD OF AUSTRALIAN STREAMS,**
Monash Univ., Clayton (Australia). Dept. of Civil Engineering.
T. A. McMahon.
In: Hydrology Symposium, Armidale, Australia, 1975. The Institution of Engineers, Australia, Preprints of Papers, p 107-111, May 1975. 12 fig, 3 tab, 10 ref.

Descriptors: *Australia, *Streamflow, *Variability, Low flow, Persistence, Water yield, Streams, Discharge(Water), Asia, Europe, North America, Correlation analysis, Duration curves, Water storage, Reservoirs.
Identifiers: Storage-yield relationships.

Low flow hydrologic characteristics of 156 Australian streams were reviewed and results compared with Asian, European and North American streams. Coefficients of variation and skewness, serial correlation, low flows as defined by flow duration curves and storage-yield values were studied. Australian streams were considerably more variable than northern hemisphere ones. The coefficient of variation was more highly correlated with other characteristics than the mean flow. Empirical equations relating reservoir-storage capacity per mean annual flow to the coefficient of variation were developed. (CSIRO)

**SUBSURFACE FLOW FROM SNOWMELT TRACED BY TRITIUM,**
Swiss Federal Inst. for Snow and Avalanche Research, Davos-Weissfluhjoch.
J. Martinec.
Water Resources Research, Vol 11, No 3, p 496-498, June 1975. 3 fig, 8 ref.

Descriptors: *Subsurface runoff, *Melt water, *Tritium, *Tracers, Groundwater movement, Snow, Runoff, On-site investigations, Infiltration, Discharge(Water), Hydrograph analysis, Lysimeters, Dispersion, Velocity, Radioisotopes, Recession curves.
Identifiers: *Residence time, Radioactive decay.

An explanation was offered of the apparent discrepency between the small velocities of subsurface flow and the watershed response. Environmental tritium in the hydrological cycle provided evidence for a new insight into the runoff mechanism. By this concept the quick reaction of outflow to a massive groundwater recharge was brought to agreement with the long residence time of the infiltrated water. (Visocky-ISWS)

**DETERMINATION OF REGIONAL HYDRAULIC CONDUCTIVITY THROUGH USE OF C-14 DATING OF GROUNDWATER,**
Geological Survey, Reston, Va.
B. B. Hanshaw, and W. Back.
Reprint from Memoires de l'Association Internationale des Hydrogeologues, Montpellier, France, Vol 10, No 1, p 195-196, September 1974. 3 fig, 7 ref.

Descriptors: *Hydraulic conductivity, *Groundwater movement, *Radioactive dating, *Carbon radioisotopes, Tracers, Hydrogeology.

In order to model and quantify a hydrologic system, one needs to know the boundary conditions, aquifer thickness, and the regional distribution of the hydraulic conductivity. Obtaining sufficient values for the hydraulic conductivity by means of a few pumping tests, core analyses, and tracer tests, so as to be meaningful on a regional scale, has long been a serious constraint on groundwater modeling. However, by using a form of Darcy's law that relates hydraulic conductivity, porosity, gradient of potentiometric surface, and velocity, it is possible to determine hydraulic conductivity if the other variables are known. Porosity can be estimated by standard methods and hydraulic gradient can be obtained directly from the potentiometric surface. Velocity can be calculated from the C-14 ages of carbonate species dissolved in groundwater. The technique of determining regional hydraulic conductivity distribution and solving the equation of groundwater flow was tried in central Florida and gave values of hydraulic conductivity that are in agreement with values obtained by traditional methods. **GROUND WATER IN THE CORVALLIS-ALBANY AREA, CENTRAL WILLAMETTE VALLEY, OREGON,**
Geological Survey, Reston, Va.
F. J. Frank.
Available from Supt. of Documents, GPO, Washington, D.C. 20402, $1.95 in paper copy. Water-Supply Paper 2032, 1974. 48 p, 9 fig, 2 plate, 7 tab, 13 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Hydrogeology, *Hydrologic data, *Oregon, Water wells, Alluvial aquifers, Well data, Drillers logs, Geology, Water supply, Water yield, Water quality.
Identifiers: *Corvallis-Albany area(Ore), Central Willamette Valley(Ore).

The Corvallis-Albany area is part of the alluvial plain that lies between the Cascade and Coast Ranges in the central Willamette Valley in northwestern Oregon. The alluvial deposits (sand and gravel) of the valley plain contain the most productive aquifers in the area and are considered to be the only units feasible for large-scale development of groundwater supplies. During 1971 the seasonal decline of water levels from winter to late summer averaged about 10 feet for the alluvial deposits. The seasonal change of storage was estimated to be about 130,000 acre-feet. Of this volume, about 14,000 acre-feet was pumped from wells; the rest was discharged through seeps and springs by evapotranspiration. The difference between pumpage and natural discharge indicates that a great quantity of additional water is available for development. The storage capacity of the alluvial aquifers is estimated to be about 750,000 acre-feet between depths of 10 and 100 feet. Water from the alluvial deposits is chemically suitable for all uses, as is most of the water from perched-water bodies in the older sedimentary and volcanic rocks. (Woodard-USGS)

**STUDY OF CRITERIA AND MODELS ESTABLISHING OPTIMUM LEVEL OF HYDROGEOLOGIC INFORMATION FOR GROUNDWATER BASIN MANAGEMENT,**
Minnesota Univ., Minneapolis. Dept. of Geology and Geophysics.
H. O. Pfannkuch.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 719, $6.25 in paper copy, $2.25 in microfiche. Minnesota Water Resources Research Center, Minneapolis, Bulletin No 81, April 1975. 165 p, 27 fig, 4 tab, 94 ref. OWRT A-027-MINN(1).

Descriptors: *Hydrologic data, *Model studies, *Groundwater, *Water management(Applied), Decision making, *Optimization, Simulation analysis, Data collections, Design.
Identifiers: *Sensitivity analysis

Information is a structural part of the decision making process. The role of the information gathering process can best be described as a Bayes' process to improve preposterior distributions in probability assignments that will serve as basis for decision making processes. Hydrogeologic information is characterized by a low degree of predictability and high variability. The general cost structure of the hydrologic information gathering process is represented in information cost curves which are combined with production cost or opportunity loss curves to give total cost curves. These may display a minimum which is the point of diminishing returns at which exploration activities should be ceased. One of the main unsolved problems is the proper definition of a universally applicable unit of information content. Optimum levels of information can only be established when utility functions can be expressed in monetary terms and give rise to clear objective functions. Three case histories were used to develop guidelines for the design and operation of monitoring systems for special wastes, minimum hydrogeologic information needed in watershed district management, and the need and role of information in the choice and construction of a proposed simulation model for a regional system under complex decision rules. **MANAGEMENT OF RETARDATION OF SALT WATER INTRUSION IN COASTAL AQUIFERS,**
North Carolina State Univ., Raleigh. Dept. of Civil Engineering.
A. I. Kashef.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-244 721, $8.75 in paper copy, $2.25 in microfiche. Completion Report, July 1975. 281 p, 103 fig, 17 tab, 53 ref. OWRT (C-4061)(No 9013)(2).

Descriptors: *Aquifer management, *Artesian aquifers, *Artificial recharge, *Finite element analysis, *Saline water-freshwater interfaces, *Saline water intrusion, Earth dams, Free surface, Groundwater resources, Optimization, Well spacing.
Identifiers: Artesian recharge wells, *Coastal aquifers, Salt water retardation, Finite element mesh, *Hydraulic forces method, Equipotential lines, Freshwater barriers, Rectangular earth sections, Streamlines, Velocity vectors.

The free surface in rectangular earth sections or cores of earth dams were determined by the finite element method using a new technique of horizontally displaced mesh. Ten cases were solved and compared with a previously developed and simpler method in which the hydraulic forces were analyzed and which resulted in closed form mathematical solutions. The comparison indicated that the method of hydraulic forces can satisfactorily be used in artesian aquifers to locate the saline water-freshwater interface which is analogous to the free surface in earth dams. The solved cases corresponded to a wide range of coverage of practical conditions. The effects of recharge wells under the transient flow conditions were then superimposed on these due to the natural flow in order to determine the degree of salt water retardation. Single wells as well as battery of recharge wells parallel to the coast line were analyzed. In all cases, dimensionless parameters were used to allow for the changes in the pump capacities and the time intervals. Various well locations were examined and in the case of well batteries various spacings were introduced. The optimum conditions corresponding to desired degrees of salt water retardation are indicated. Freshwater barriers resulted under certain conditions yet these were outside the scope of this project.

K. Doi, S. Hirono, and Y. Sakamaki.
Economic Geology, Vol 70, No 4, p 628-646, June-July 1975. 25 fig, 7 tab, 22 ref.

Descriptors: *Groundwater, *Percolating water, *Leaching, *Mineralogy, Water properties, Groundwater movement, Geology, Rocks, Granites, Sedimentary rocks, Fissures(Geologic), Spring waters, Adsorption, Deposition(Sediments), Petrology.
Identifiers: *Uranium, *Japan, Mineralization, Carbonaceous matter, Ores.

To solve the mechanism of uranium concentratio in stratabound uranium deposits occurring in t basal part of Neogene sediments overlying grani basement, attention has been paid to uraniu leaching from weathered granite by circulati carbonated fissure waters, to effective adsorbe for fixing uranium from uraniferous groun waters, to structural features controlling t groundwater circulation, and to other relevant fa tors. The evidence for uranium transportation hydrothermal solutions, including hot spri waters, was had to observe. It was concluded: uranium in the deposits is supplied from surrou ing source rocks, mostly from granite. (2) urani is transported by circulating groundwater so tions; (3) the uranium dissolved in graoundwate fixed in minerals in various ways, the most imp tant being adsorption by carbonaceous matter; ore-grade uranium concentrated from very di solutions occurs by multiple repetition of leaching-and-fixation cycle between minerals adsorbents and circulation uraniferous grou water; and (5) important factors for urani mineralization are sufficient uranium (supp mostly from granite), the existence of effective sorbents such as carbonaceous matter in the h rocks, and favorable geological, geochemical, geophysical environments. The last seem require not only physical and chemical conditi but also corrent flow and volume of groundwa (Sims-ISWS)

s, *Soil classification, *Soil surfaces,
gations, *Soil physical properties, Soil
perties, Soil chemistry, Soil environ-
rosion, Soil formation, Soil horizons,
, Soil properties, Soil structure, Soil
types.

The characteristics of desert soils in the southwestern United States are contrasted and compared with soils for more humid climates. An overview is presented of the physical characteristics, vegetation, and human impact on desert soils. Physical makeup of desert soils, including mineral and organic matter and soil matter and air content is explained. The soil forming features of the desert (climate, vegetation, topography, parent material and time) are discussed individually and their interaction under certain conditions is elaborated. Topsoil appearance and subsurface structure are explained in relation to mineral content, weathering and the desert fauna which exist in the soil. The last chapter demonstrates how to classify soils into groups and the appendix gives soil classification and nutrient cycle charts. (Miller-Arizona)

**SOIL MORPHOLOGY AND SOIL PHYSICAL PROPERTIES: II. MECHANICAL IMPEDANCE AND MOISTURE RETENTION AND MOVEMENT,**
Saskatchewan Univ., Saskatoon. Dept. of Soil Science.
K. W. Ayres, R. G. Button, and E. De Jong.
Canadian Journal of Soil Science, Vol 53, No 1, p 9-19, 1973. Illus.

Descriptors: *Soil physical properties, *Moisture content, Soil structure, Soil mechanics, Soil horizons, *Soil density, Chernozems, Porosity, Regression analysis, Hydraulic conductivity, Bulk density.
Identifiers: Solonetzic soils, *Soil mechanical impedance.

The relations among soil structure, soil mechanical impedance and moisture retention and movement were investigated on undisturbed soil cores from soil horizons exhibiting 6 distinct kinds of soil structure (prismatic, columnar, blocky, granular, platy, massive) over a broad range of soil texture. Mechanical impedance was characterized by measurements of bulk density and soil strength. Moisture retention and movement were characterized by measurements of 1/3-atm moisture content and saturated hydraulic conductivity. The columnar structures from Solonetzic soils were singled out as having a higher mechanical impedance and lower hydraulic conductivity than the other structures, most of which were sampled from Chernozemic soils. Total porosity (P) and bulk density (Db) were highly correlated; however, the regression coefficient for P vs. Db for columnar structures was significantly higher than that found for the other 5 structural types. Regression equations predicted that the hydraulic conductivity of platy structures could be zero for samples having as much as 15% air-filled pore space at 1/3-atm suction as compared with 6-8% for the other structures.--Copyright 1973, Biological Abstracts, Inc.

**MOISTURE AND ENERGY CONDITIONS IN A DRAINING SOIL MASS,**
Georgia Univ., Athens. School of Forest Resources.
W. L. Nutter.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-244 726, $4.75 in paper copy, $2.25 in microfiche. Georgia Environmental Resources Center, Atlanta, Report No ERC-0875, June 1975. 88 p, 15 fig, 4 tab, 26 ref. OWRT A-025-GA(2), 14-31-0001-3510.

Descriptors: Watersheds(Basins), *Forest watersheds, *Recession curves, Subsurface drainage, *Soil water movement, Percolation, Soil properties, Subsurface flow, Unsaturated Flow, Tensiometers, *Subsurface runoff, Model studies, Slopes, Soil moisture, Moisture content, Energy, Drainage.
Identifiers: *Hillside drainage, Matric potential, Soil mass.

A 6.1 m long, 1.2 m deep and 0.3 m wide soil model was constructed in the laboratory. The model may be mechanically raised from the horizontal to a 27-degree angle. The model was packed with a mixed subsurface horizon soil composed of 51 percent sand, 21 percent silt and 28 percent clay. The objective was to study the effects of slope angle and soil depth on the moisture and energy conditions within a draining soil mass and their relationship to streamflow depletion. Three slopes (25, 15, and 5 degrees) were drained at three depths (120, 80 and 40 cm), a total of nine drainage sequences. As drainage continues the equipotential lines of hydraulic head approach a position normal to the surface. The degree of divergence from normal increases with decrease in slope angle. Water content gradients suggest that a zone of active water movement migrates downslope during drainage and may migrate back upslope during the input of rainfall. The zone may identify the limits of source areas during stormflow. Of the variables studied, slope angle exerts the greatest influence over the nature of drainage from a soil mass. Response of a moderately step and moderately deep slope will be similar to that of a steep and deep slope.

**AVAILABLE WATER-HOLDING CAPACITIES OF SOILS IN SOUTHERN IDAHO,**
Idaho Agricultural Experiment Station, Aberdeen.
R. E. McDole, G. M. McMaster, and D. C. Larsen.
Current Information Series No 236, June 1974. 4 p, 2 fig, 3 tab.

Descriptors: *Soil moisture, *Available water, *Retention, *Idaho, Root zone, Soil-water-plant relationships, Wilting point, Moisture content, Field capacity, Subsurface waters, Soils, Soil physical properties, Soil water, Soil texture, Soil types, Laboratory tests, Infiltration, Agriculture.
Identifiers: *Available water-holding capacities.

To manage moisture on agricultural cropland, one must know how much water and soil profile can hold and store for plant use. This is called the available water-holding capacity of the soil and is usually expressed as inches of water per foot of soil depth. The available water-holding capacity of any soil can be calculated from: (1) the thickness of the horizons that make up the soil profile, and (2) the moisture characteristics of these horizons. The first of these - the kind, arrangement and thickness of soil horizons - can be determined by examining the soil profile. The second factor, the moisture characteristics of these horizons, can be determined by laboratory analyses. Laboratory studies that determined water-holding capacities of specific soils (soil series) and soil texture classes in southern Idaho were reported. Samples for this study were collected from agricultural areas across southern Idaho. Each of the samples was analyzed in laboratory pressure chambers to determine water-holding capacity values. A method called ceramic plate extraction was used to establish a desorption curve for each sample. These curves were the basis for determining the permanent wilting point and field capacity. These values, in turn, were used to calculate available water-holding capacity for each soil. (Sims-ISWS)

**LIMNOLOGY OF DESERT PONDS,**
Arizona Univ., Tucson. Dept. of Biological Sciences.
S. R. Alcorn.
Arizona University, Tucson, Department of Biological Sciences, MS Thesis, 1974. 45 p, 3 fig, 6 tab, 31 ref, 2 append.

Descriptors: *Limnology, *Ponds, *Fisheries, *Warm-water fish, *Arizona, Water properties, Sampling, Water sampling, Data collections, Water analysis, Water temperature, Dissolved oxygen, Hydrogen ion concentration, Aquatic plants, Euphotic zone, Thermal stratification.
Identifiers: Photic zone.

The limnology of five types of ponds in Southern Arizona was studied from October 1972 to September 1973 to provide information for the use of ponds as fisheries. Temperature, oxygen, pH, and photic zone measurements were made monthly. Diel studies of temperature, oxygen, and pH were conducted in July. Weather conditions caused thermal stratification to begin in February and last through October in deeper ponds. Complete nightly summer circulation occurred in most ponds. Shaded ponds were no cooler than open ponds. Winter oxygen concentrations were above 5 mg/l in all ponds. Winter oxygen concentrations were suitable for warm-water fish year round and trout from November through April. The best type of ponds were those filled with well water rather than those supplied by runoff. (McLachlan-Arizona)

**SOME LIMNOLOGICAL CHARACTERISTICS OF ARIVACA LAKE IN SOUTHERN ARIZONA,**
Arizona Univ., Tucson.
J. C. Tash, and C. D. Ziebell.
Journal of the Arizona Academy of Science, Vol 10, No 1, p 8-14, February 1975. 4 fig, 3 tab, 11 ref.

Descriptors: *Arizona, *Limnology, *Aquatic environment, *Sport fishing, *Lake fisheries, *Artificial lakes, Lakes, Water temperature, Dissolved oxygen, Light penetration, Benthos, Aquatic microorganisms, Zooplankton, Aquatic life, Water sampling, Organic matter, Fish, Fish management.
Identifiers: *Arivaca Lake(Ariz).

Scarcity of water in Southern Arizona gives premium value to all waters that provide aquatic-related recreation. Larger lakes, all of which are man-made, receive particularly heavy recreational use primarily in the form of sport fishing. Value and use of these lakes for sport fishing are directly related to the quality and productivity of the water. Data are presented on temperature, dissolved oxygen, zooplankton, and benthos for Arivaca Lake, the most recently constructed of four large man-made lakes. These data can be used for future studies that will improve management of fisheries in other Southern Arizona lakes. (Robinett-Arizona)

Descriptors: *Thermal pollution, *Thermal stratification, *Lakes, *Computer programs, *Computer models, *Reservoirs, Numerical analysis, Digital computers, Simulation analysis, Currents(Water), Circulation, Thermocline, Equations, Model studies.

The study led to a simplified and two-dimensional, numerical model capable of representing stratification and thermally unstable flows in lakes. The Navier-Stokes equations, a heat balance equation, the continuity equation, and an equation relating fluid density to temperature are combined to form a closed system. The Boussinesq approximation is used; a hydrostatic pressure distribution is assumed. A sub-grid-scale turbulence model provides a variable eddy viscosity for diffusion calculations. The numerical model follows a Marker-and-Cell-style format in variable placement, upstream differencing was used for convection terms, and FORTRAN is the program language. The model was implemented for use on an IBM 370/168. Favorable comparisons with other models were obtained. A long-term, large-scale stratification process was simulated and quantitative agreement with laboratory experiments was obtained. —

Technical Report 95, Cornell University Water Resources and Marine Sciences Center, Ithaca, New York, April 1975. 48 p, 7 fig, 1 tab, 3 ref, 1 append. OWRT A-047-NY(2) and B-048-NY(2).

Descriptors: *Aquatic life, *Ecology, *Computer programs, *Data collections, Computers, Lakes, Water quality, Depth, Phytoplankton, Temperature, Water chemistry, Biological properties, Carbon dioxide, Dissolved oxygen.
Identifiers: Data reduction, Pigment ratios.

Aquatic ecology frequently requires the collection of large amounts of field data. These data can be condensed into a manageable and meaningful form using a computer. Several computer programs developed to meet the specialized needs of data common to aquatic ecology are presented. These programs are useful for data reduction and arrangement, and several have been designed to produce output for subsequent use in available statistical program packages. They are flexible and basically simple, thus having wide applicability and appeal to the computer novice. The programs are classified into three groups: (1) generalized programs applicable to many forms of limnological data -- INTEGRATE and AVERAGE, (2) specialized programs for chemical data--CO2 and DO SAT, and PIGMENT RATIO, and (3) specialized programs for biological data--SPECIES and SUCCESSION. The programs are written in Fortran IV except for SPECIES which is written in PL/1. All have been run on an IBM 360 and IBM 370, but conversion to other systems should not be difficult. The programs are described in detail, and an appendix includes program listings and examples of the outputs. (Bell-Cornell)

Descriptors: *Phytoplankton, Lakes, *Digestion, Herbivores, *Fish, Africa.
Identifiers: *Haplochromis-nigripinnis, *Tilapia-nilotica, *Uganda(Lake George).

A direct method was used to estimate the amount of phytoplankton ingested per day by herbivorous fish in Lake George, Uganda. The quantities ingested are linearly related to the weight of the fish, as given by the following regression equations: for Tilapia nilotica: $y = 271 + 13.3\ x$ and for Haplochromis nigripinnis: $y = -29.6 + 21.9\ x$, where y is the dry weight of photoplankton (mg) ingested per day and x is the wet weight of the fish (g).--Copyright 1974, Biological Abstracts, Inc.

Identifiers: Punta Cirio(Mexico), Sonora(Mexico), Baja California(Mexico).

Phenological changes observed at Punta Cirio within an approximate 50 meter radius and no more than 100 meters from the Gulf of California coast were evaluated. Seasonal patterns are evident, particularly with respect to certain taxa, but the important controlling factor may be available moisture rather than temperature or other seasonal variables. Most of the vegetation is comprised of various shrubs, half-shrubs and cacti. Phenological data are presented for 20 Sonoran Desert species. (Robinett-Arizona)

South Australia Dept. of Agriculture, Adelaide.
P. S. Cocks, and C. M. Donald.
Australian Journal of Agricultural Research, Vol 24, No 1, p 1-10, January 1973. 1 fig, 7 tab, 9 ref.

Descriptors: *Soil-water-plant relationships, *Grasses, *Germination, *Seeds, *Plant growth, Soaking, Wetting, Drying, Soil surfaces, Loam, Vegetation establishment, Soil water, Absorption, Water injury, Grasslands, Pastures, Osmotic pressure, Moisture stress, Plant physiology, Seed treatment.
Identifiers: Hordeum leporinum Link, Lolium regidum Gaud.

Studies under controlled conditions show that Hordeum leporinum Link germinates more quickly than Lolium rigidum Gaud. at all temperatures. Lolium requires alternating temperatures for maximum germination; Hordeum shows little response to temperature variation. Germination of both species is depressed at temperatures above 30C and inhibited at 36C and above. Soaking Hordeum seeds for 10 hours and Lolium for 18, then drying and rewetting seeds stimulates germination of both species. Longer soaking depresses germination rates. Controlled experiments on soil surface show Hordeum better able to germinate with small amounts of water. Absorption studies indicate water uptake of seeds is identical for both species. Hordeum was able to germinate in solutions of higher osmotic pressure than was Lolium. (Michael-Arizona)

**ENVIRONMENTAL IMPACT EVALUATION IN FRESHWATER IMPOUNDMENTS BY VEGETATION ANALYSIS OF THE TERRESTRIAL ECOSYSTEM,**
Massachusetts Univ., Amherst. Water Resources Research Center.
P. W. Fairbairn, and C. A. Carlozzi.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 505, $6.25 in paper copy, $2.25 in microfiche. Publication No. 49, Completion Report FY-75-4, April 1975. 141 p, 22 tab, 37 fig, 18 append, 27 ref. OWRT A-053-MASS(1). 14-31-0001-4021.

Descriptors: Evaluation, *Environmental effects, Vegetation, *Ecosystems, *Ecology, Rivers, Floods, *Floodwater, Management, Impoundments, *Vegetation effects, *Massachusetts, Damsites.

The objective was to develop and test a method of analyzing the ecological impact of artificially impounded floodwaters on the terrestrial environment. The approach was to apply techniques of field ecology to three similar river systems each subject to a different management regimen, with a view to determining levels of relative community stability in terms of successional maturity. Degree of environmental impact was described in terms of vegetative characteristics correlated with elevation, including life form, species dominance, diversity indices, biomass, seasonal distribution of flowering, method of seed dispersal, and number of exotics and annuals present. Emphasis was on community rather than single-species attributes. These characteristics were correlated negatively or positively in a consistent fashion with degree of flooding intensity. A composite graph was drawn up displaying in an additive way nine vegetative characteristics. By this means it was possible to show the cumulative impact of flooding across a vertical range of 60 feet. On the strength of the characteristics used it was considered possible to define the relative levels of community stability at each of the three rivers studied, at different levels of flooding stress.

**SEASONAL VARIATION IN COMPOSITION, PLANT BIOMASS, AND NET PRIMARY PRODUCTIVITY OF A TROPICAL GRASSLAND AT KURUKSHETRA, INDIA,**
Kurukshetra Univ. (India). Dept. of Botany.
J. S. Singh, and P. S. Yadava.
Ecol Monogr. Vol 44, No 3, p 351-376, 1974, Illus.

Descriptors: *Seasonal, *Primary productivity, *Biomass, *Grasslands, Vegetation, Distribution, Water pollution effects.
Identifiers: *India(Kurukshetra), *Tropical grasslands.

The variation in composition, plant biomass, net primary productivity was analyzed in a tropical grassland situated within the campus of the Kurukshetra University, India, at 29 deg 58' latitude and 76 deg 51' E longitude. A study of forms indicated a therocryptophytic spectrum. Detailed phytosociological values of constituent species of the vegetation were studied at monthly intervals (May 1970-May 1971) through tillering analysis. Most of the species were found to be gregariously distributed. The changes throughout the year in the aboveground plant biomass, standing dead, litter, and belowground biomass showed that maximum aboveground biomass in Sept. (1167 g/sq m) and maximum belowground biomass in Nov. (1167 g/sq m). Examination of vertical distribution of the aboveground biomass of the vegetation as well as of the individual species indicated that different layers of vegetation were dominated by different species in different months. The aboveground net primary production was maximum during the rainy season (1700 g/sq m), and the belowground maximum occurring the winter season (785 g/sq m). Total annual net primary production is estimated to be 3 g/sq m. The system transfer functions revealed that productivity was more aboveground-directed

e wet period and more belowground-directed
g the dry period. Annual efficiency of energy
re by the primary producers was calculated
1.66% on the basis of half total incident solar
ion.--Copyright 1974, Biological Abstracts,

nearshore and estuarine waters of
estern Florida, particularly Florida Bay
jacent areas, provide feeding and nursery
s for the young of many species of fish and
h. The multimillion dollar pink shrimp fishery of the Sanibel and Tortugas grounds is an outstanding example of production derived from this zone. Until comparatively recently the fish fauna of this region were poorly known. Baseline data were compiled on fishes inhabiting the estuarine and nearshore waters between Cape Romano and Cape Sable. Increasing conflicts of interest between the forces of conservation and those of development point to the immediate need for comprehensive evaluation of this area. Fish and commercial invertebrates taken at each station are tabulated. Nearly 32,000 finfish representing 114 species were collected. Fifty-five species were of commercial value and 24 of sport value. Over 2800 individuals of six species of commercial invertebrates were collected. Nomenclature and sequence of fishes are given in the annotated list. Environmental data where each species was collected are summarized. Salinity, water temperature or range, water depth or range, and bottom type or range are given. Sponges and hard or soft corals were also noted. (Jones-Wisconsin)

**THE AQUATIC WEED PROBLEM. 1. IDENTIFICATION,**
Victoria State Coll., Carlton (Australia). Dept. of Plant Physiology.
F. Eady.
New Zealand Journal of Agriculture, Vol 129, No 2, p 40, 41, 43, 45, 1974. 5 fig.

Descriptors: *Aquatic weeds, *Aquatic plants, *Varieties, Plant groupings, Floating plants, Rooted aquatic plants, Submerged plants, Water hyacinth, Pondweed, Foreign countries, Drainage systems.
Identifiers: *New Zealand, Duckweed, Water ferns, Azolla rubra, Azolla pinnata, Salvinia herzogii, Lemna minor, Wolffia arrhize, Spirodela oligorhhiza, Elodea canadensis, Lagarosiphon major, Egeria densa.

Of 34 aquatic weed species which cause problems in New Zealand, 29 are importations. Three broad groups consist of free-floating, submergent, and emergent species. The free-floating weeds are water ferns (Azolla and Salvinia), duckweeds, and water hyacinth. Two Azolla species can be identified by their roots: Azolla rubra roots hang straight down and are unbranched; Azolla pinnata roots branch and have fine hairs. Azolla rubra develops a deep red-brown color. The leaves of Azolla pinnata are more pointed. They reproduce rapidly so are difficult to eradicate. Salvinia herzogii is a brownish-green plant with folded hairy leaves. Three species of duckweed are found. Lemna minor has only one root per green frond. Spirodela oligorhhiza has two or more roots. Wolffia arrhiza var. Australiana (water-meal) has no roots. Eradication is almost impossible. Water hyacinth, Eichhornia crassipes, is hard to eradicate because the seeds are long-lived. Three members of the submerged groups are Elodea canadensis (Canadian pondweed), Lagarosiphon major (oxygen weed), and Egeria densa (egeria). Elodea leaves occur in threes, egeria in fours and fives, and those of Lagarosiphon are alternate. (Buchanan-Davidson--Wisconsin)

## 2J. Erosion and Sedimentation

**MEASUREMENT OF COBBLE ABRASION IN NATURAL STREAMS,**
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
F. R. Carlson.
Arizona University, Tucson, Department of Hydrology and Water Resources, MS Thesis, 1974. 64 p, 12 fig, 6 tab, 25 ref, append.

Descriptors: *Abrasion, *Bed load, *Stream erosion, *Sediments, *Arizona, Weathering, Bedrock, Friction, Model studies, Streamflow, Particle size, Mathematical models, Measurement.
Identifiers: *Cobble abrasion.

Particle size of sediment in natural streams is modified by sorting, mixing, solution, and abrasion. Dynamic bed-load friction was not calculable, but varies directly with the size and concentration of moving bed loads. Wear was related to total work by abradibility, roundness, and rock strength. Abrasion efficiency of traceable cobbles in ephemeral streams in southern Arizona varied approximately with discharge squared. Field wear measurements compared well with prior laboratory model measurement. Changes in roundness while being transported over bedrock and en route weathering greatly affected the abrasion efficiency in natural streams. (McLachlan-Arizona)

**FACTORS AFFECTING EROSION IN A SEMI-ARID WATERSHED,**
Arizona Univ., Tucson. Dept. of Civil Engineering and Engineering Mechanics.
L. R. Davis.
Arizona University, Tucson, Department of Civil Engineering and Engineering Mechanics, MS Thesis, 1974. 89 p, 22 fig, 15 ref.

Descriptors: *Erosion, *Channel erosion, *Stream erosion, *Watersheds(Basins), *Semiarid climates, Erosion control, Sediment transport, Rainfall simulators, Erosion rates, *Arizona, Watershed management, Sediment yield, Sedimentation, Forecasting, Soil physical properties, Equations.
Identifiers: *Sycamore Creek(Arizona), Musgrave equation, Laursen equation.

Three separate erosion studies conducted in the Sycamore Creek watershed of Arizona concluded that a combination of rainfall simulator tests and an analysis of channel sediment-transport capacity provided the best estimate of the erosion potential of the watershed. The erosion rates were not a steady process. Previous studies treated erosion as a steady process and tended to grossly over-predict erosion. The first study was an application of the Musgrave erosion equation to the watershed. The equation predicted erosion with only a small degree of reliability. The second, or channel study was an application of the Laursen equation to the ephemeral stream that transports the erosion material from the watershed. This indicated that the channel could not transport the erosion material. The third, or rainfall simulator study established that the erosion material that could possibly be supplied to the Sycamore Creek channel was less than predicted in the initial study. **STOCHASTIC ANALYSIS OF PARTICLE MOVEMENT OVER A DUNE BED,**
Geological Survey, Bay Saint Louis, Miss.
B. K. Lee, and H. E. Jobson
Open-file report 75-358, March 1975. 205 p, 20 fig, 75 tab, 17 ref

Descriptors: *Sediment transport, *Particle size, *Model studies, *Alluvial channels, *Stochastic processes, Streamflow, Analytical techniques, Equations, Dune sands, Sediments.
Identifiers: River dune bed.

Stochastic models are available that can be used to predict the transport and dispersion of bed-material sediment particles in an alluvial channel. These models are based on the proposition that the movement of a single bed-material sediment particle consists of a series of steps of random length separated by rest periods of random duration and, therefore, application of the models requires a knowledge of the probability distributions of the step lengths, the rest periods, the elevation of particle deposition, and the elevation of particle erosion. The procedure was tested by determining distributions from bed profiles formed in a large laboratory flume with a coarse sand as the bed material. The elevation of particle deposition and the elevation of particle erosion can be considered to be identically distributed, and their distribution can be described by either a 'truncated Gaussian' or a 'triangular' density function. The conditional probability distribution of the rest period given the elevation of particle deposition closely followed the two-parameter gamma distribution. The conditional probability distribution of the step length given the elevation of particle erosion and the elevation of particle deposition also closely followed the two-parameter gamma density function. For a given flow, the scale and shape parameters describing the gamma probability distributions can be expressed as functions of bed elevation. (Woodard-USGS)

J. C. Duplessy, L. Chenouard, and F. Vila.
Science, Vol 188, No 4194, p 1208-1209, June 20, 1975. 1 fig, 16 ref.

Descriptors: *Isotope studies, *Glaciers, *Benthic fauna, *Glacial sediments, Temperature, Sea water, Core logging, Cores, Oxygen, Stable isotopes, Glaciology, Sedimentology, Oceanography, Deep water, Sinks.
Identifiers: *Norwegian Sea, *North Atlantic, Foraminifera.

Oxygen isotopic analyses of pelagic and benthic foraminifera from core K 11 indicate that during the last glaciation Norwegian Sea bottom waters were warmer than in modern times and had the same physical parameters (temperature, oxygen isotope ratio, and salinity) as the North Atlantic deep water. This result indicates that the glacial Norwegian Sea was not a sink for dense surface water, as it is now, and that during glacial times North Atlantic deep water invaded the deep Norwegian basin. **DENUDATION STUDIES: CAN WE ASSUME STREAM STEADY STATE,**
Wisconsin Univ., Milwaukee. Dept. of Geography.
S. W. Trimble.
Science, Vol 188, No 4194, p 1207-1208, June 20, 1975. 1 fig, 9 ref.

Descriptors: *Erosion, *Sedimentation, *Streams, *Southeast US, Sediment yield, Erosion rates, Alluvium, Colluvium, Bed load, Suspended load, Suspended solids, Sediment transport, Agriculture, Reservoirs, Rivers.
Identifiers: Gross erosion, Eroded materials.

Contemporary stream sediment loads are dubious indicators of regional denudation. Recent analysis of 10 river basins in the southeastern United States indicates that of the material eroded from upland slopes since European settlement, only about 5% has been exported. The remainder, alluvium and colluvium, will probably not be exported because of extensive reservoir impoundments. (Sims-ISWS)

**MASS-EMPLACED SAND-FINGERS AT MARAROA CONSTRUCTION SITE, SOUTHERN NEW ZEALAND,**
Otago Univ., Dunedin (New Zealand). Dept. of Geology.
R. M. Carter.
Sedimentology, Vol 22, No 2, p 275-288, May 1975. 9 fig, 15 ref.

Descriptors: *Sediments, *Sedimentary structures, *Sediment transport, Mass transfer, Sands, Sand waves, Sedimentation, Sedimentology, Movement, Excavation, Dam construction, Deposition(Sediments), Geomorphology.
Identifiers: *New Zealand, Sand fans, Sand fingers.

During work on a dam construction site in South Island, New Zealand, outflowing groundwater resulted in extensive local mass transport of the sands being excavated. A series of small scale sand fans was built up, probably mainly by laminar mass-flow processes. The surfaces of the fans were made up of a series of complexly interdigitating sand fingers that are inferred to have been emplaced by viscous plug flow. Other sedimentary processes associated with the building and synsedimentary destruction of the fans included rapid grain flow, liquefaction, and progressive slumping. Although small in scale, the Mararoa mass-flow-fans may be a close analogue for some of the many 'fluxoturbidite' or 'proximal flysch' facies described in the sedimentological literature. Their geologic implications were therefore briefly discussed. (Sims-ISWS)

**SIZE-SORTING DURING SUSPENSION TRANSPORTATION--LOGNORMALITY AND OTHER CHARACTERISTICS,**
Indian Statistical Inst., Calcutta. Geological Studies Unit.
S. Sengupta.
Sedimentology, Vol 22, No 2, p 257-273, May 1975. 13 fig, 2 tab, 13 ref.

Descriptors: *Sediments, *Sieve analysis, *Sediment transport, *Particle size, Suspended solids, Sands, Sediment sorting, Sediment load, Bed load, Running waters, Laboratory tests, Flumes, Sedimentation, Sedimentology, Distribution patterns, Velocity, Turbulent flow.
Identifiers: Lognormality.

Grain size distributions of the suspended load above a bed of bimodal size distribution (size range 2.00-0.04 mm) were studied in a laboratory flume at water velocities varying from 42 to 16 cm/s. With increase of velocity, the ph (logarithmic) size distribution of the suspended particles (at 5-20 cm above the bed) changed fro a strongly skewed to a nearly symmetrical unimodal form (nearly lognormal) through an in termediate bimodal stage. At low velocity, th skewness of the distribution changed from pos tive to negative with increase of height. The ex periments indicate that lognormality of 'weigh frequency' distribution of grain sizes is a trans tional feature, attained through size sorting with a critical range of velocity and height above a san bed of a given composition. The observed change in the size distribution patterns were effected by differential rate of increase in weight in the di ferent size classes in suspension with increase flow velocity. The phenomenon could be ex plained by the equation of relative suspension con centration which relates the relative concentratio of a suspended particle of a particular diameter the flow velocity of the turbulent fluid and th height of suspension above the bed. (Sims-ISWS)

**SALT AND SPECIFIC ION EFFECTS ON GERMINATION OF FOUR GRASSES,**
Arizona Univ., Tucson. Dept. of Soils, Water, and Engineering.
J. Ryan, S. Miyamoto, and J. L. Stroehlein.
Journal of Range Management, Vol 28, No 1, p 61-64, January 1975. 1 tab, 2 fig, 12 ref.

Descriptors: *Range grasses, *Range management, *Salt tolerance, *Grazing, *Revegetation, Salts, Germination, Osmotic pressure, Erosion control, Irrigation, Drought tolerance, Ions, Chlorides, Sulfates.
Identifiers: Blue panicgrass, Lehmann lovegrass, Wilman lovegrass, Weeping lovegrass.

The effects of NaCl, CaCl2, MgCl2, Na2SO4, MgSO4, and CaSO4 on four range grasses, blue panicgrass. Lehmann lovegrass, Wilman lovegrass, and weeping lovegrass were investigated. Increased salt concentrations decreased germination, but the species and type of salt varied the extent of the decrease. Inhibition was greatest with Mg and least with Ca salts. At equal osmotic pressures the effect of specific ions also varied. Wilman and weeping lovegrasses were relatively salt tolerant. Germination of range grass species is influenced not only by salt concentrations, but also by the nature of the ions in the salt solution. Based on this information, plant species selections can be chosen that are best adapted to native soil conditions or where the salt composition has been altered by management or irrigation. Limnology and Oceanography, Vol 20, No 3, p 463-467, May 1975. 1 tab, 30 ref. ONR Contract N00014-67-A-0369-0007.

Descriptors: *Water chemistry, *Atlantic Ocean, *Pacific Ocean, *Inorganic compounds, *Chemistry, Bodies of water, Stratification, Chemical analysis, Salinity, Oxygen, Dissolved oxygen, Hydrogen ion concentration, Alkalinity, Silicates, Phosphates, Nitrates, Chemical properties, Mineralogy, Sea water, Chlorides, Sampling, Sediments.
Identifiers: *Near-bottom chemistry, *Caribbean Sea.

Near-bottom chemistry at depths greater than 2000 m was studied in the eastern tropical Pacific (27 stations), the north-eastern Pacific (9 stations), the Caribbean Sea (1 station), and the North Atlantic (2 stations). Salinity oxygen, pH, alkalinity, silicate, phosphate, and nitrate were measured at eight heights from 0.6 to 300 m above the bottom. No measurable salinity, oxygen, alkalinity, silicate, phosphate, or nitrate gradients were observed. A statistically significant near-bottom increase in pH was found, but the increase was small and could have resulted from undetected analytical or sampling errors. (Henley-ISWS)

Geological Survey, Menlo Park, Calif.
R. H. Mariner, T. S. Presser, J. B. Rapp, and L. M. Willey.
Open-file report, August 1975. 27 p, 2 fig, 9 tab, 11 ref.

Descriptors: *Chemical analysis, *Hot springs, *Basic data collections, *Nevada, *Oregon, Water quality, Thermal water, Geothermal studies, Water quality, Water chemistry, Inorganic compounds, Trace elements, Gases, Sampling, Analytical techniques.

Current interest in the geothermal potential of hot spring areas in Nevada and Oregon makes all data on hot springs in these areas valuable. Tabulated without interpretative comment are compositions of gases (oxygen plus argon, nitrogen, methane, and carbon dioxide), deuterium and oxygen (18) contents of the hot spring waters, trace and minor element chemical data for hot springs sampled in 1972 and 1973, and complete chemical analyses for several hot springs sampled in 1974. The detection limits for nickel and selenium were 0.05 mg/liter and 0.003 mg/liter, respectively. Detectable amounts of nickel were found in Oregon at Olene Gap Hot Spring (0.05 mg/liter) and in Nevada at West Pinto Hot Spring (0.05 mg/liter). Selenium in detectable amounts (0.003 mg/liter or more) was found in Oregon at Hunters Hot Springs (0.008), and in Nevada at the steam geyser at Needle Rocks (0.006), Bog Hot Springs (0.004), and the unnamed hot spring in Jersey Valley (0.003). A STUDY OF FACTORS CONTROLLING THE CHEMICAL QUALITY OF WATER IN CARTWRIGHT CREEK BASIN, WILLIAMSON COUNTY, TENNESSEE,
Vanderbilt Univ., Nashville, Tenn. Dept. of Geology.
C. L. Sprinkle.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-244 830, $6.25 in paper copy, $2.25 in microfiche. Ms Thesis, Water Resources Research Center Report No 42, August 1973. 147 p, 20 fig, 10 tab, 23 ref, 4 append. OWRT B-018-TENN(2). 1431-0001-3650.

Descriptors: *Water chemistry, *Dissolved solids, *Streams, *Tennessee, Runoff, Groundwater, Water quality, Geology, Rocks, Soils, Chemistry, Chemical analysis, X-ray spectroscopy, Water analysis, Chemicals, Sampling, Leaching, Erosion, Chemical properties, Hydrology.
Identifiers: *Dissolution rates, *Cartwright Creek(Tenn).

This study was made to determine the factors controlling the geochemistry of ground and surface waters in a small carbonate drainage basin. In order to obtain a somewhat geographic sample of the 6 geologic formations and 14 soil types exposed in the basin, a total of 30 individual rock and soil samples were collected. Rates of dissolution for the major chemical constituents from the rock and soil samples were determined after 1, 2, 4, 8, 16, 32, 65, 130, 250 days. Assuming a 0.5 day mean-residence time for most of the water flowing from Cartwright Basin, a simple empirical model related the laboratory-measured dissolution rates of the rock and soil units with their porosities and areal extent in the basin to predict the concentrations of 5 ions common to the water flowing in Cartwright Creek. A water sample collected during high flow in Cartwright Creek on July 17, 1972 (approximately one-half day after a storm) had measured values for the 5 ions that matched the predicted concentrations. The model was less successful in predicting ion concentrations for the 12-month average Cartwright Creek chemical load. (Sims-ISWS)

STABILIZATION AND RECONSTRUCTION OF TEXAS COASTAL FOREDUNES WITH VEGETATION,
Texas Tech Univ., Lubbock.
B. E. Dahl, B. A. Fall, A. Lohse, and S. G. Appan.
Gulf Universities Research Consortium, Galveston, Texas, Report 139, August, 1974. 343 p, 55 fig, 41 tab, 20 append, 89 ref. DACW 72-72-C-0013.

Descriptors: *Coastal engineering, *Shore protection, *Vegetation effects, *Vegetation establishment, *Erosion control, Texas, Coasts, Beach erosion, Beaches, Soil erosion, Tidal effects, Waves(Water), Dunes, Sands, Wind erosion, Plant populations, Land management, Soil conservation, Soil stabilization, Cover crops, Planting management, Grasses.
Identifiers: *Padre Island, Beach grasses, Sea oats, Bitter panicum.

Experiments were conducted from 1969 to 1974 on Padre Island, Texas, to to establish technical specifications and methodologies for the use of beach grasses to construct and stabilize foredunes along the Gulf Coast as storm surge barriers. Bitter panicum and sea oats were the best adapted species for beach plantings, with winter through spring being the most favorable transplanting period. Foredunes were established across overwash channels by creating an elevated, flat, relatively salt-free surface using parallel rows of two-foot-high sand fencing, and then transplanting both grasses. (Robinett-Arizona)

J. J. Leendertse, and S-K. Liu.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 501, $5.75 in paper copy, $2.25 in microfiche. Completion Report R-1764-OWRT, June 1975. 123 p, 62 fig, 26 ref, 4 append. OWRT C-5252(No 4237)(1).

Descriptors: *Estuaries, *Mathematical models, *Numerical methods, Tides, Fluid dynamics, Computer models, Coastal engineering, *Finite differences, *Simulation analysis, Unsteady flow, *Model studies, Bays, Coasts.
Identifiers: *Three-dimensional flow model.

Different computational aspects of the use of a three-dimensional finite-difference model of estuaries, bays, and coastal seas are described. With this model, salinity and temperature distributions can be computed, together with the flow field, and then coupled to the flow computation by a complicated equation of state. In the model an approximation for the sub-gridscale effects is introduced by use of mass and momentum exchange coefficients. The vertical exchanges are dependent on the Richardson number. The model is tested in bays and estuaries with widely different characteristics (Grevelingen, Chesapeake Bay, San Francisco Bay, and the Strait of Juan de Fuca). The results are presented in graphic form. Effective simulations can be made with the model. (See also W74 04301)

iers: *Matagorda Island(Tex).

ɔrda Island is a wide, sand-rich, barrier-complex on the central Texas coast. This initially formed as an intermittently emer-and shoal which migrated landward during e Holocene transgression and then became ed as the Gulf of Mexico reached stillstand. baerial portion of the island complex rests lanket of middle Holocene Bay-estuarine hich was desposited behind the landward-ng sand body and then was overridden by llowing stillstand, Matagorda Island led Gulfward approximately 1.6 km. During ogradation, two large tidal passes, which ted the Gulf of Mexico with San Antonio esquite Bays, were closed. The island was modified by migration of Cedar Bayou miles to the west across the island's n end. Two sources of sand contributed to rier complex. Prior to stillstand, erosion of cene strandplain sand and middle Holocene deltaic sand exposed on the shelf supplied the sediment to the early barrier. Follow-stand, with progradation, shelf sands were ply submerged to be eroded by Gulf waves. scharged into the Gulf by the Colorado and Rivers and transported southwestward by re currents was desposited on the beach reface of Matagorda Island. al systems must be examined from a spec-views ranging from those of high perspec-tive-low detail to those of low perspective-high detail. Such a spectrum should provide complementary views of real world systems, the 'true' nature of which is beyond our capacity to perceive. A high perspective low detail view is employed herein to examine the organization, function, and requirements of whole estuarine systems. Concerns pertinent to comprehensive environmental planning of estuaries are identified. A planning approach that calls for the uneven distribution of development activities among Oregon's estuarine systems is presented. This approach places a high value on environmental variety, including a wide range of undeveloped ecosystems. Cluster communities with intervening open space are called for within systems selected for development. A number of methods, concerns, and problems related to the implementation of this approach are identified. Although the method is recommended for Oregon's estuaries, emphasis is given to general concepts that have wider applicability. (Bell-Cornell)

Office of Water Research and Technology, Washington, D.C.
M. E. Mattson.
Water and Wastes Engineering, Vol 12, No 4, p 35, 36, 38, 40, 42, April, 1975. 7 fig.

Descriptors: *Waste water treatment, *Municipal water, *Membrane processes, Electrodialysis, Reverse osmosis, Capital costs, Operating costs, Design, Economics, Desalination processes, *Treatment facilities, California, Colorado River.
Identifiers: Brackish water desalting.

Two large brackish water membrane desalting plants are near completion. One, in Santa Ana, California, has planned a multi-phase program for its 75 mgd facility to test reverse osmosis (RO), electrodialysis (ED), and ion exchange. On the lower Colorado River, an even larger desalting plant, of 100 mgd, is planned, with a test facility at Yuma, Arizona to evaluate pre-treatment and to compare reverse osmosis, and electrodialysis and the use of a combination of these two processes. Design characteristics, advantages, problems, and costs of RO and ED are detailed. While both methods have only recently been applied to large municipal water systems (ED in 1962, RO in 1971), treatment plant personnel have been satisfied with each. Economic comparisons of the two membrane processes indicate that: the two desalting applications are competitive with each other; with low salinity brackish waters (under 5000 ppm TDS), ED has a slight advantage over RO; capital costs and operating costs for ED systems decreases more rapidly with increasing plant size; and, RO is not as sensitive to variations in feed salinity as ED. Actual operating and capital costs at several large municipal plants show that local conditions such as plant load factors or fouling problems cause much variation. Both reverse osmosis and electrodialysis are recommended for future usage. (Prague-FIRL)

U.S. Patent No 3,893,902, 5 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 936, No 2, p 653-654, July 8, 1975.

Descriptors: *Patents, *Sea water, *Desalination, Waste water treatment, *Water purification, *Electrolysis, Electrodes, Anodes, Cathodes.
Identifiers: Hypochlorite.

A method is provided for the electrolysis of sea water which reduces the formation of undesirable deposits on the electrodes of the cell and produces hypochlorite. The cell is comprised of an enclosure containing vertically placed electrodes in an alternating array of anodes and cathodes. Sea water is introduced to the cell at a point below the electrodes through a series of orifices corresponding in number and location to the cathodes. The direction of the orifices is such that the sea water first impinges primarily on nonelectrode surfaces immediately subjacent the electrodes at a velocity of between 5 and 25 feet per second. The sea water velocity through the cell is maintained sufficient to at least suspend substantially all particulate matter present. Electrolysis is intermittently halted and the cell is flushed with sea water introduced through orifices at a point above, and directed onto the electrodes. This removes a slurry of particulate material from the bottom of the cell and electrolysis can be resumed. (Sinha-OEIS)

**SYSTEM FOR OPTIMAL PRESSURE CONTROL IN A MULTI-STAGE EVAPORATION UNIT,**
Deutsche Texco A.G., Hamburg. (West Germany). (assignee)
A. Hoppe, and W. Geistert.
U.S. Patent No 3,894,915, 4 p, 3 fig, 11 ref; Official Gazette of the United State Patent Office, Vol 936, No 3, p 998, July 15, 1975.

Descriptors: *Patents, *Water quality, *Water pollution treatment, *Evaporation, Condensation, Distillation, Equipment, Evaporators, *Heat exchangers, Desalination.

A system for optimal pressure control in a multi-stage evaporation unit is comprised of two or more series connected evaporation stages with at least one of the stages preceded by a heat source. The fresh or feed solution is passed through heat exchangers where it is heated by means of the vapors from the subsequent evaporation stages. The heat exchanger is adapted to permit free flow of the vapor condensate through the heat exchanger inner portion. The heat exchanger installed in the line through which the vapor effluent leaves the higher-pressure evaporation unit acts as a throttling means to permit unimpeded passage of the vapor condensate and assumes the pressure expanding function formerly performed by the pressure control valve. Research Paper RM-128, October, 1974. 28 p, 12 fig, 9 tab, 78 ref.

Descriptors: *Water yield improvement, *Vegetation effects, *Pinyon pine trees, *Juniper trees, Herbicides, Forages, Small watersheds, Sediment yield, Water quality, Wildlife, Recreation, *Arizona, Multiple-purpose projects.

Results of water yield improvement tests are evaluated with regard to their impacts on multiple uses of the land. Included in this examination are water quality and quantity, overstory vegetation, understory vegetation, potential livestock carrying capacity, wildlife values, and recreation and aesthetics. Pinyon-juniper removal was done by cabling, herbicide, and felling in an attempt to improve water yields. Of the three treatments only the herbicide treatment with picloram appears to provide an increase in water yield, but the negative aesthetic effect of dead standing trees was undesirable. Overstory vegetation removal will result in a severalfold increase in herbage production for livestock and wildlife. There was no meaningful increase in sediment yield as a result of overstory removal. A combination of herbicide treatment and fire appears the most promising method for future juniper control research from the standpoint of water production, forage production, deer response, and economics. F. R. Crow, and A. L. Mitchell, Jr.
Water Resources Research, Vol 11, No 3, p 493-495, June 1975. 4 fig, 8 ref. Bureau of Reclamation Contract 14-06-5629.

Descriptors: *Evaporation control, *Winds, *Films, *Lakes, *Oklahoma, Evaporation, Hexadecanol, Octadecanol, Slurries, Application equipment, Application methods, Retardants, Thin films, Research and development, Alcohols, Rates of application, Wind velocity.
Identifiers: *Lake Hefner(OK), Wind direction.

An evaporation suppression research project was conducted at Lake Hefner, Oklahoma, where water-based slurries of hexadecanol and octadecanol were applied at the upwind side of the lake by an offshore sprinkler system. The distribution system was designed for maximum film cover under south winds. The chemical was applied at a variable rate adjusted to the demand created by local wind speed and direction. The application rate required to replace film removed by the wind, in terms of pounds per hour per foot of distribution line perpendicular to the wind, averaged 6.5-8 times greater than for an experimental pond with a similar application system. The upper wind speed limit for successful film application was 13 miles per hour (mph). Distribution studies were made to determine the percent of time that wind speeds and directions were favorable to the application of film, i.e., with speeds less than 13 mph and direction between 135 degrees and 225 degrees azimuth. Under wind conditions experienced in Oklahoma it was difficult to maintain continuous film cover because of the frequency of occurrence of high wind speeds and shifts in wind direction. **AN APPRAISAL OF POTENTIAL WATER SALVAGE IN THE LAKE MCMILLEN DELTA AREA, EDDY COUNTY, NEW MEXICO,**
Geological Survey, Reston, Va.
E. R. Cox, and J. S. Havens.
Available from Supt. of Documents, GPO, Washington, D.C. 20402, $1.50 in paper copy, Water-Supply Paper 2029-E, 1974. 26 p, 4 fig, 2 plate, 8 tab, 11 ref.

Descriptors: *Water conservation, *New Mexico, *Evapotranspiration control, *Phreatophytes, *Tamarisk, Reservoirs, Evapotranspiration, Water yield improvement, Water reuse.
Identifiers: *Lake McMillan(N Mex).

The amount of water used by saltcedar in the area of the old delta of Lake McMillan, New Mexico, and the amount of water that might be salvaged by eradication of saltcedar by construction of floodways through the delta area are estimated. Saltcedar growth increased from about 13,700 acres in 1952 to about 17,000 acres in 1960, a 25% increase. Most of this increase was in the areal density range near zero to 30%. The estimated average transpiration of phreatophytes in the Artesia to Lake McMillan reach is 29,000 acre-feet of water per year. In the reach from Artesia to the Rio Penasco, where the regional water table is above the Pecos River, saltcedar eradication might salvage from 10,000 to 20,000 acre-feet of water per year for use downstream. From the Rio Penasco to Lake McMillan, the river is perched above the water table; therefore, elimination of the saltcedar would probably not increase flow in the river, nor would drains be effective. Clearing of the [illegible] however might increase the flow at Malaga Bend Springs below Lake McMillan. However, through this reach would [illegible] evaporation but might [illegible] the sediment [illegible] by floodwater in Lake McMillan. (Woodard-USGS)

ak water load demand on municipal systems n caused by water used to maintain urban apes. Research was conducted to determine ls for reducing water used on urban land-and to enhance the esthetic role of plants in an landscape. Two broad approaches were ed: evaluation of water application on landscapes in relation to size and type of pe; and description of esthetic dimensions n landscapes in relation to water consumed. nts applied more water than needed to n the landscape, and the specific amounts ed upon the season and landscape type. An ent, the Residential Landscape Descrip-uestionnaire (RLDQ), was developed for he esthetic qualities of a residential land-The evidence indicated the RLDZ was eliable and valid. The most feasible method ucing municipal peak water usage is to ze excesses and utilize landscape design which conserve water and are esthetically ve. In view of the fact that residents tend to p to 50% more water than needed to main-esthetic and health qualities of the land-t is recommended that an educational pro-initiated to improve the water application s as well as the design of landscapes as one ue for reducing the amount of water used ntain residential landscapes. **STATUS OF WASTE HEAT UTILIZATION AND DUAL-PURPOSE PLANT PROJECTS,**
Oak Ridge National Lab., Tenn.
S. E. Beall, and M. M. Yarosh.
Available from the National Technical Information Service, Springfield, Va 22161 as CONF-73-1101-56, $4.00 in paper copy, $2.25 in microfiche. Presented at the American Nuclear Society meeting, San Francisco, California, November 11-16, 1973. 44 p, 18 fig, 5 tab, 26 ref. AEC 731101-56.

Descriptors: *Heat transfer, *Heated water, *Heating, *Aquiculture, *Return flow, Energy transfer, Powerplants, Tennessee Valley Authority, Commercial shellfish, Catfishes, Steam, Thermal power, Agriculture, Greenhouses, Europe, Heat exchangers, Fish farming, Asia.
Identifiers: *Waste heat, *Dual purpose energy plants, Mariculture, Ploesti(Romania), Japan.

One method for conserving energy is to use heat which has been discharged from some conversion mechanism or industrial process. Although there are incentives to use discarded heat, there are also disincentives: the necessity of locating the user near the heat source, the potential interruptable nature of the service, the possibility of chemical or radioactive contamination, and seasonal variation in source temperature. The status of several pioneering projects in the substitution of once-used heat for heat from fossil fuels is reported. Demonstrations of the economic feasibility of closed-environment agriculture warmed by waste heat, proposed by the Oak Ridge National Laboratory-TVA and by the Northern States Power Company as well as projects already completed by the University of Arizona, are described. The utilization of warm discharge water for irrigation and frost protection for outdoor agriculture and for aquaculture and mariculture is discussed. Salt water shrimp, catfish, oysters, clams and abalone have been successfully raised experimentally in warm waste water enhanced environments. The status of several dual-purpose (electrical power and industrial steam) energy plant projects is assessed. Although significant savings in fuel and improvements in overall efficiency are possible from dual-purpose plants, only limited application of the concept has been made. (Becker-Wisconsin)

**THE WATER INDUSTRY IN TRANSITION,**
National Water Council, London (England).
P. E. Stott.
Conference of British Industry Review, No 13, p 22-31, 1974. 1 fig.

Descriptors: *Water management(Applied), *Water policy, *Administrative agencies, Water supply, Water quality control, Regions, Europe, Sewerage, Financing, Income, Regional analysis, Water districts.
Identifiers: *England, *Wales, *Regional administration.

The implementation of the 1973 Water Act in England and Wales called for a radical restructuring of the administration of water and sewerage functions. Nine regional water authorities in England and the Welsh National Water Development Authority were set up based on river basins, the role of the twelve-member National Water Council was defined, the Water Research Centre was established, and the Water Space Amenity Commission was created. The ten multi-functional regional authorities are responsible for water resources and supply; sewerage and sewage disposal; the prevention of pollution; land drainage and flood protection; fisheries; the recreational and amenity use of their water space; and in some cases, for navigation. The new jurisdictional units need updated information on costs, standards and the state of repair as well as research and development support. Local authorities remain as agents for the development and maintenance of local sewerage systems, and statutory water companies remain as agents for the supply of water within their areas. The coordination of workers from many local authorities remains an important objective. New financing strategies, although authorized, have not been used due to administrative obstacles. A summary of detailed objectives of the massive reorganization is included. (Becker-Wisconsin)

## 3F. Conservation In Agriculture

**EFFECTS OF IRRIGATION IN RAIN-FED FIELDS ON THE GROWTH AND YIELD OF UPLAND RICE VARIETIES, (IN KOREAN),**
Kyungpook National Univ., Taegu (Republic of Korea). Coll. of Agriculture.
S. Y. Jeh.
Res Rep Off Rural Dev (Crop) (Suwon), 16 p 127-132, 1974. Illus.

Descriptors: *Rice, *Irrigation, *Crop production, Growth rate.

Differences of the characters and yield of 14 upland and 2 lowland rice varieties cultivated under irrigated, partially-irrigated and dry field conditions were studied. Under dry conditions, heading and maturity were greatly delayed and ratios of valid tillers, fertilized spiklets and ripening and yield in both rough and brown rice were relatively lower, while numbers of tillers and spikelets and straw weight were greater under the other 2 conditions. There was not substantial difference in growth and yield of rice between the irrigated and partially-irrigated conditions.--Copyright 1975, Biological Abstracts, Inc.

**EFFECTS OF ANTITRANSPIRANTS ON YIELD OF GRAIN SORGHUM UNDER LIMITED IRRIGATION,**
New Mexico State Univ., Clovis. Plains Branch Agricultural Experiment Station.
H. D. Fuehring.
Agronomy Journal, Vol 65, No 3, p 348-351, 1973.

Descriptors: *Antitranspirants, *Crop production, *Sorghum, Irrigation, Stomata, Grain(Crops).
Identifiers: Atrazine, Folicote, Phenylmercuric acetate.

The proper material, method and timing of appl. cation for field use was determined. Under limite irrigation conditions in the field, grain sorghum (Sorghum bicolor (L.) Moench) was sprayed a various rates and times with phenylmercuri acetate (PMA), atrazine and Folicote. Mean grai yield increases of 5-17% were obtained. Rates application required were approximately 60 g/h for PMA, 130 g/ha for atrazine, and 2 l/ha for Fo icote. Application just prior to the boot stage w more effective than a later application.--Copyrigh 1973, Biological Abstracts, Inc

**SUCCESSFUL IRRIGATION: PREPARATION REALIZATION, EXPLORITATION, (SAVOI IRRIGUER: PREPARATION, REALISATION EXPLOITATION),**
California Univ., Davis. Dept. of Irrigation.
R. M. Hagan, C. E. Houston, and S. V. Allison.
Food and Agriculture Organization of the Unite Nations, Rome, 1968. 53 p.

Descriptors: *Irrigation programs, *Planning *Management, *Institutions, *Project planning Costs, Economic feasibility, Water utilization.

Successful irrigation, its planning, development and management, are described to assist polic makers, administrators, and planners to discharg more effectively their roles in the development o irrigated agriculture. Successful irrigation require a skillful combination of the accumulate knowledge in many professional field, includin engineering, water-soil-plant sciences, an economic and other social sciences. Guidelines ar suggested for the preparation of project proposal their appraisal, and implementation. The sul sequent management calls for experienced judg ment, gased on a high degree of professional con petence. (Paylore-Arizona)

**THE EARLY VEGETATIVE GROWTH OF TV ANNUAL PASTURE GRASSES (HORDEU**

ORINUM LINK AND LOLIUM RIGIDUM
UD.),
th Australia Dept. of Agriculture, Adelaide.
. Cocks, and C. M. Donald.
tralian Journal of Agricultural Research, Vol
No 1, p 11-19, January, 1973. 3 fig, 5 tab, 11

criptors: *Germination, *Plant growth,
eds, *Grasses, *Planting management, Soil-
er-plant relationships, *Australia, Weight,
ves, Root systems, Plant physiology, Vegeta-
establishment.
tifiers: Hordeum Leporinum Link, Lolium
lum Gaud.

y vegetative growth of Hordeum leporinum
Lolium rigidum was studied at 10, 17, and 24C
controlled environment cabinet. Growth rates
Lolium were generally higher than for Horde-
and significantly so at 17C. Seedling growth
in each species was more rapid during the
od of endosperm availability than after en-
erm exhaustion. Following emergence, Hor-
n seedlings were larger in total weight, leaf
root weight, root depth and plant height
use of their greater seed size. The duration of
leum's greater size depended upon tempera-
being least (26 days) at 17C, the temperature
Lolium's optimum growth. Implications of
findings in pasture production in southern
ralia are that in sparse stands Lolium
ings will overtake Hordeum, and in dense
ls the reverse will occur. (Michael-Arizona)

r consumption and turnover of Merino sheep
ng on three vegetation communities were stu-
Water requirements are high due to high tem-
ures and low moisture content of the forage
dry season. On Danthonia caespitosa grass-
maximum water intakes were 3 to 3.5 liters
eep per day. On saltbush (Atriplex vesicaria)
belah-rosewood (Casuarina cristata -
odendrum oleifolium) communities, water
es were up to 6 to 7 liters per day in summer.
rovision of shade reduced water turnover by
imum of 0.3 to 0.5 liters per day on some oc-
ns only, indicating that shade is of little im-
nce of woolled sheep. Water turnover was
ured by tritium dilution. The high water in-
of the sheep were attributed mainly to the
mineral content of the Atriplex and Bassia
aten. Shearing in the cool season is clearly a
practice in this region of New South Wales.

INFLUENCE OF DENSITY AND
OGEN ON THE OUTCOME OF COMPETI-
BETWEEN TWO ANNUAL PASTURE
SSES (HORDEUM LEPORINUM LINK AND
UM RIGIDUM GAUD.),
Australia Dept. of Agriculture, Adelaide.
Cocks.
alian Journal of Agricultural Research, Vol
o 2, p 247-258, March 1974. 6 fig, 4 tab, 17

Descriptors: *Competition, *Nitrogen, *Pastures, *Grasses, *Plant growth, Density, *Australia, Growth rates.
Identifiers: Hordeum leporinum Link, Lolium rigidum Gaud.

The hypothesis that the outcome of competition between Hordeum leporinum Link. and Lolium rigidum Guad. depends mainly on the density of the Hordeum in a pasture was tested. The results are explained in terms of the hypothesis and of the different abilities of the two species to absorb soil nitrogen, which is rarely applied to annual pastures and often deficient. In the first experiment, it was found that the competitive ability of Hordeum was closely related to its density. Hordeum was most competitive when its density was highest. In the second experiment, soil nitrogen was an importand modifying factor. At low nitrogen, Hordeum was the successful competitor, and its competitive ability decreased with increases in its density. At high nitrogen, Lolium became the successful competitor. (Mastic-Arizona)

**PRODUCTS FROM JOJOBA: A PROMISING NEW CROP FOR ARID LANDS.**
National Research Council, Washington, D.C. Committee on Jojoba Utilization.
National Academy of Sciences, 1975. 30 p, 8 fig, 7 tab, 11 ref.

Descriptors: *Indian reservations, *Southwest, US, *Desert plants, Arid lands, Water requirements, Cultivation, Crop production, Hydrogenation, Productivity, Wax, Seeds, Seed treatment.
Identifiers: *Jojoba, *Economic plants, Plant uses.

In the expectation that an industry based on the seed oil of the desert bush jojoba (Simmondsia chinensis) would improve the economies of Indian reservations in the southwestern desert regions of the U.S., a scientific and technical assessment was made of the practical uses of jojoba oil. The cultivation of jojoba, the manufacture of products from it, and the utilization of its by-products are discussed, with the conclusion that jojoba oil and its hydrogenated product have marketable properties. Special attention is directed to its value to increase productivity of arid lands not suitable for conventional crops, particularly because of its tolerance to extreme desert temperatures and minimal rainfall. Since the plant needs moisture during the winter and spring, its growth schedule fits well with an arid environment where water is needed when it is scarce. It appears to be tolerant of both saline and alkaline soils and to saline irrigation water. The 1972 harvest of 87,000 pounds of seed from wild plants was used for the laboratory work done to support the Committee's conclusions, but the future of the plant lies in developing it into a cultivated crop. Accompanying tables illustrate the wax and protein content of jojoba seeds, characteristics of sulfurized jojoba and sperm oils, and other comparisons. (Paylore-Arizona)

Govind Ballabh Pant Univ. of Agriculture and Technology, Pantnagar (India). Dept. of Soil Science.
A. K. Saha, B. P. Ghildyal, and M. S. Gangwar.
Indian J Agric Sci, Vol 43, No 5, p 472-477, 1973.

Descriptors: *Roots, *Soil water, *Transpiration, Ions, Absorption, *Rice, Porosity, Loams, Dry matter, Production, Soils.
Identifiers: Oryza-Sativa, *India.

A pot experiment was conducted on a silty clay-loam soil of Nainital tarai (subhumid and submontane belt at the base of the Himalayas) to investigate the influence of soil-water regimes on rice (Oryza sativa L.) cultivars 'Jaya' and 'IR 8,' grown under flooded condition and field capacity. A variation in the soil-moisture regimes from field capacity to flooded condition resulted in a great increase in the total root porosity, transpiration, nutrient uptake and dry matter production. Dry matter production and nutrient uptake showed a high positive correlation with the total amount of water transpired. The amount of water transpired/day/plant was positively correlated with the total root porosity/plant. More nutrient uptake as a result of increased availability of nutrients, together with greater transpirational transfer of water and ions facilitate by increased root porosity, resulted in an increase in the growth of rice plant under flooded condition.--Copyright 1974, Biological Abstracts, Inc.

**USE OF AMENDMENTS TO REDUCE WATER REQUIREMENTS FOR STAND ESTABLISHMENT OF SMALL-SEEDED CROPS,**
Arizona Univ., Tucson. Dept. of Plant Sciences.
R. E. Dennis, C. E. Edmond, and C. W. Robbins.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 722,

$3.75 in paper copy, $2.25 in microfiche. Completion Report, August 1975. 15 p, 16 ref. OWRT A-034-ARIZ(3). 14-31-0001-5003.

Descriptors: Soils, Alfalfa, Sugarbeets, *Soil amendments, *Southwest U.S., Wheat, Barley, Irrigation water, Water requirements.
Identifiers: *Sulfuric acid, *Phosphoric acid, *Soil crusting.

Soil crusting after planting is a serious problem in stand establishment of small-seeded crops in the Southwest. When crusting occurs in a saline, warm soil, stand establishment problems are especially severe. It is customary to use costly irrigation water to keep seedbed surfaces moist after planting to reduce soil crusting, and to lower soil temperatures. Phosphoric acid (24% and 12%) and sulfuric acid (95%) were evaluated to determine their effectiveness in reducing soil crusting and to reduce the amount of water required to obtain stands of sugarbeets, alfalfa, wheat and barley. Phosphoric acid applied in 4-6 cm bands over the seed row at planting and before irrigation, reduced crusting and significantly increased sugarbeet and alfalfa seedling emergence. Emerged seedlings from phosphoric acid treated plots were larger and one irrigation (10-15 ha cm/ha) was saved in stand establishment. Sulfuric acid applied in bands reduced soil crusting. Soluble salts in the seed zone resulting from band application of sulfuric acid killed or damaged seedlings. Sulfuric acid when applied in irrigation water, to saline-sodic soils, improved plant growth and water use efficiency.

**SCHEDULING AND APPLICATION RATES OF IRRIGATION IN A HUMID CLIMATE,**
Alabama Agricultural Experiment Station, Auburn.
C. D. Busch, and E. W. Rochester.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 760, $3.75 in paper copy, $2.25 in microfiche. Bulletin 470, Agricultural Experiment Station, Auburn University, June 1975. 38 p, 10 fig, 6 tab, 15 ref, 5 append. OWRT A-025-ALA(3).

Descriptors: Irrigation, Weather forecasting, *Rates of application, *Application methods, *Irrigation practice, *Humid climates, *Supplemental irrigation, Soil moisture, Water demand, Crop production, *Cotton, On site investigation.
Identifiers: Simulation studies, Irrigation by demand, Irrigation scheduling.

A four-year study of two irrigation scheduling methods and application rates was conducted to determine more efficient uses of supplemental water in a humid climate. One model based on the decision to irrigate on weather forecast and soil moisture conditions; the other, irrigation by demand, based on soil moisture conditions only. Two application rates of 0.13 in/hr (low) and 0.43 or 0.7 in/hr (high) were used. A computer program was developed to calculate soil moisture and predict irrigation needs in the forest scheduling model. A 0.5 probability of rainfall greater than 0.5 inch was the low limit. The weather forecast also provided the basis of deciding how much rainfall would be included in the soil moisture balance. The inclusion of weather forecast was insignificant. However, irrigation in itself did improve yields. The method of irrigation by demand improved production 160 lbs. of seed cotton per acre for each inch of water applied. Simulation studies following the field experiment supported the results of the field study. In the associated application rate study the low application rate of 0.13 inches per hour was superior in cotton production and in the minimization of soil crust strength. The study also suggested that an exponential relation is appropriate for relating crust strength to crust moisture content

Tottori Univ. (Japan). Sand Dune Research Inst.
T. Cho, T. Yamamoto, and Y. Takeuchi.
Sand Dune Research Institute, Bulletin No 14, p 1-8, March 1975 2 fig, 3 tab, 8 ref. English summary.

Descriptors: *Greenhouses, *Sands, *Irrigation, *Irrigation effects, Dunes, Sprinkler irrigation, Irrigation practices, Irrigation systems, Agronomic crops, Plant growth, Plastics, Fertilization, Application methods.
Identifiers: *Trickle irrigation, *Japan.

Two varieties of netted melon, Earls Favorite and Shinhoro, growing in plastic greenhouses in a sand field, were irrigated using the trickle irrigation method. Net fruit development and sugar content of Earls Favorite were greater using trickle irrigation than that obtained using sprinkler irrigation methods. Net development of the fruit of Shinhoro was greater on single vine plants than on two, three, or four vine plants. By examining and correlating nozzle flow rates, trickle times, and liquid fertilizer applications involved in trickle irrigation systems, new methods for netted melon cultivation may be developed. **NOZZLE HYDRAULICS IN THE TRICKLE IRRIGATION SYSTEM--RELATION BETWEEN WATER TEMPERATURE AND NOZZLE FLOW RATE (IN JAPANESE),**
Tottori Univ. (Japan). Sand Dune Research Inst.
T. Yamamoto, and H. Kawasaki.
Sand Dune Research Institute, Bulletin No 14, p 9-14, March 1975 7 fig, 2 tab, 3 ref. English summary.

Descriptors: *Irrigation, *Application methods, *Rates of application, *Flow rates, *Nozzles, Sprinkler irrigation, Irrigation practices, Irrigation systems, Pressure, Flow, Water temperature.
Identifiers: *Trickle irrigation, *Japan.

The flow rate of the trickle nozzle which connects with the distribution pipe of a trickle irrigation system is dependent on pressure, water temperature, and the dimensions of the spiral flow path. The pressure and dimensions of the spiral flow path constant, nozzle flow rate varies with water temperature, which acts on the kinematic viscosity coefficient. A formula for the calculation of nozzle flow rate at any given temperature is presented. Calculated values are found to agree well with experimentally determined values. (Frondorf-Arizona)

**PRACTICAL APPLICATION OF SURFACE FIXED-SYSTEM FOR MULTI-PURPOSE SPRINKLER IRRIGATION USES, (IN JAPANESE),**
Tottori Univ. (Japan). Sand Dune Research Inst.
T. Cho, T. Yamamoto, Y. Takeuchi, Y. Nomura, and M. Inoue.
Sand Dune Research Institute, Bulletin No 14, p 15-24, March 1975 7 fig, 6 tab, 4 ref. English summary.

Descriptors: *Irrigation, *Sprinkler irrigation, *Irrigation efficiency, *Distribution systems, *Application methods, Irrigation practices, Irrigation systems, Fertilizers, Pesticides, Fertilization.
Identifiers: *Japan.

An investigation of the multiple uses of a surface fixed-system sprinkler irrigation system, including application of liquid fertilizers and pesticides was conducted. Uniformity coefficient and pattern efficiency of the sprinkler system were computed by measuring the height of water caught in cans. These two factors were then used to estimate the sprinkler distribution efficiency. Investigations of the ratio of wetting area of chemical spray to leaf area, for different sprinkler types and for different amounts of spray, were conducted on Dioscorea opposita (chinese yam) and Raphanus sativus (radish). It is concluded that the fixed system is a feasible sprinkler irrigation method for multiple uses. (Frondorf-Arizona)

**IMPROVING PRODUCTIVITY IN LOW RAINFALL AREAS, IN INDIA.**
Food and Agriculture Organization of the United Nations, Rome (Italy).
Food and Agriculture Organization of the United Nations, Rome, Italy. COAG/74/4, Appendix I, April, 1974. 16 p, 2 tab.

Descriptors: *Farm management, *Arid climates, *Land use, *Land management, *Dry farming, Productivity, Plant growth, Climatic zones, Dry seasons, Semiarid climates, Soil types, Soils, Land tenure, Groundwater, Rainfall, Infiltration, Runoff, Crop production, Education, Arid lands, Water utilization, Wells, Fertilizers, Planting management.
Identifiers: *India

A general overview is given of climate, soils, land and culture of areas in India where agricultural projects are under study. These 54 projects in low rainfall areas comprise 30 percent of India's cultivated land area. The study is aimed at determining the most efficient and non-wasteful use of water from wells and rainfall. Crop production techniques, crop varieties, use of fertilizers, planting and after care are examined. Animal husbandry works best in certain climatic and vegetative areas and can be improved through irrigation. Programs of agricultural extension, education, and a federal farm credit program have provided assistance to the participants in the projects. Tables are given on projects, crops grown, yields, and yield increases. The objectives, organization and staffing patterns of dryland research centers and integrated dryland development projects of India are described. (Miller-Arizona)

**THE EFFECT OF IRRIGATION ON THE YIELD AND QUALITY OF MAINCROP POTATOES,**
L. W. Wellings.
Exp Husb, 24 p 54-69, 1973. Illus.

Descriptors: *Irrigation, Crop production, *Potatoes, *Soil moisture.
Identifiers: *Streptomyces-Scabies.

Irrigation significantly increased yield in 4 of the experiments with large increases in 2 seasons. (average irrigation throughout the growing season when soil moisture deficit (S.M.D.) reached 55% of the available water capacity (A.W.C.) in the 30 cm of soil, or irrigation when S.M.D. reached 45% A.W.C. for 4-6 wk after tuber initiation followed by irrigation when S.M.D. reached 100% A.W.C., tended to give higher yields than irrigation at S.M.D.'s of 100-140% A.W.C. after the tubers had reached a diameter of 10-20 mm. Irrigation improved the quality of tubers by decreasing the level of common scab (Streptomyces scabies) and frequent irrigation for 4-6 wk from tuber initiation gave high yields of scab-free tubers from susceptible varieties. Results in 2 yr when there were large responses indicated that 'Majestic' and 'Record' need more frequent irrigation than 'King Edward' and 'Pentland Crown' to produce the best yields. The results are used to indicate a system of irrigation for commercial production of high quality potatoes from light land.--Copyright 1974, Biological Abstracts, Inc.

lting, Dehydration, Stomata, Tomatoes,
eat, Rice, Flooding.
tifiers: *Abscisic acid, Glucose ester,
opersicon-esculentum, Oryza-sativa, Phaseo-
vulgaris, Triticum-aestivum, *Turgor, *Warm

n a continuous stream of warm air (38C) was
cted on to the leaves of dwarf bean (Phaseolus
aris) seedlings they wilted and then gradually
ined turgor. This process of adaptation was
mpanied by an increasing abscisic acid (ABA)
in the leaves and an increase in leaf re-
nce (RL). It is suggested that the leaf-water
cit induced by the warm-air treatment caused
ncrease in ABA level and that the latter was
onsible for stimulating stomatal closure,
ling the plants to regain full turgor. A similar
of adaptation, brought about by an increased
of ABA in the leaves, is believed to occur in
to (Lycopersicon esculentum), dwarf bean,
wheat (Triticum aestivum) plants when they
looded. Predictably, in rice (Oryza sativa), a
ies adapted to a flooded environment,
lings showed no increase in ABA level as a
t of flooding. Adaptation may involve the for-
on of an equilibrium between ABA and its
igate form (i.e. the glucose ester). The ABA-
igate was observed to disperse slowly from
s recovering from a water deficit; and there-
it may act as a metabolic 'back-stop,' enabling
free' ABA to remain high for a period even
the leaves have regained turgor. Abscisic
appears to be responsible for alleviating the
ts of water stress in plants, making it possible
lants to pass through periods of stress with lit-
arm.--Copyright 1974, Biological Abstracts,

**INTERNATIONAL DEVELOPMENT STRATEGIES FOR THE SAHEL.**
Rockfeller Foundation Report, May 1975. 50 p, 3 fig, 14 ref. Conference held at Bellagio, Italy, October 1974.

Descriptors: *Regional development, *Droughts, *Weather patterns, *River basin development, Water management(Applied), Administration, Research and development, Transportation, Education, Population, Livestock, Carrying capacity, Limiting factors, Arid lands, Environmental effects, *Africa.
Identifiers: *Sahelian zone, Nomadism.

This conference was devoted to an examination of the needs for achievement of long-term development of the Sahel, establishment of priorities, and means for implementation. Interest focussed on the existing Comite' Inter-Etats de Lutte Contre la Secheresse as Sahel (CILSS). Its programs based on participation by Chad, Gambis, Mali, Mauritania, Niger, Senegal, and Upper Volta, include a regional study of water management, including river basin development; transport and communications; improvement of genetic stock; reforestation; and a special development fund. The conference recommended the following strategies: (1) Infrastructure development, emphasizing road and water basin development, (2) improved participation of local people, including mass communications and education to help the people cope with their own needs, (3) long-term development, (4) resource management, (5) bringing nomadic life into better balance with the carrying capacity of the land and the availability of renewable and nonrenewable resources, (6) establishment of a regional Sahelian Institute to aid in research and development by catalyzing and mobilizing resources in the long term to bring about an improvement in the quality of life for its people. The recent drought, degradation of the environment throughout the region, and a recognition of the differences between emergency relief and long-term local management of what was acknowledged as a recurring phenomenon were additional topics for discussion. Summaries are included of papers on Weather and Climate in the Sahel, and Environmental Management. (Paylore-Arizona)

Arizona Univ., Tucson. Dept. of Biological Sciences.
R. L. Madsen.
Arizona University, Tucson, Department of Biological Sciences, MS Thesis, 1974. 60 p, 11 fig, 5 tab, 4 append, 15 ref.

Descriptors: *Herbivores, *Competition, *Rainfall, *Rainfall intensity, *Arizona, *Range management, Arid climates, Semiarid climates, Mammals, Small animals(Mammals), Wildlife, Grazing, Moisture deficit, Reproduction.
Identifiers: *Avra Valley(Ariz), *Lagomorphs.

Lagomorphs have long been recognized as important herbivores in the Sonoran desert. They are the chief competitors with cattle for the sparse grazing and available water in the southwest. Their size and mobility increase the effect they can have on their habitat. During the period of March 1971 to December 1973 lagomorphs were collected from Avra Valley, Arizona. Reproduction activity was highest during January-March and again in July-August. This roughly corresponds with the rainy seasons of the Sonoran Desert. The variance of rainfall during this period corresponded with the decline and rise in the lagomorphs population. Lack of rainfall often caused high mortality rates or forced migration, while normal rainfall increased the population and competition for grazing and water. (McLachlan-Arizona)

**INTERBASIN WATER TRANSFERS: A CASE STUDY IN MEXICO,**
Resources for the Future, Inc., Washington, D.C.
R. G. Cummings.
Distributed by The John Hopkins University Press, Baltimore, Md 1974 114 p.

Descriptors: *Inter-basin transfers, *Water transfer, *Water resources development, *Mexico, Imported water, Mexican water treaty, Economic impact, Economic justification, Mathematical models, Equations, Model studies, Urban sociology, Rural sociology, Cost-benefit analysis, Groundwater, Groundwater mining, Water table, Pumping, Project planning, Project benefits, Project purposes, Planning.
Identifiers: Northwest Water Plan, Yaqui Valley(Mexico), Costa de Hermosillo(Mexico).

The state of interbasin water transfers in Mexico is explained with detailed description of the current Northwest Project, including the project's conceptual structure and implied directions. A model which gives patterns of water transfer is evaluated for a representative year, treated parametrically from optimum pumping levels and optimal rates of pumping in the Costa de Hermosillo area. Results are applied to projections for interbasin water transfer developments. Net benefits from and costs of the water are examined in light of economic relations between the rural and urban sectors in the study region. An analysis of representative year transfers is presented and the optimum intertemporal exploitation of the Costa Aquifer is discussed. Conclusions are presented and discussed. (Miller-Arizona)

Identifiers: *Alkali sacaton.

Despite previous unsuccessful trials in planting alkali sacaton (Sporobolus airoides (Torr.) Torr) on badly eroded sites in flood plains in the semi-desert of the Southwest, experiments conducted under field conditions on the Rio Puerco drainage of northwestern New Mexico proved that this grass can be grown successfully under exacting conditions: (1) plant when soil moisture is at least 14 percent or higher (1 atm tension or less), (2) plant when probabilities for weekly precipitation are greater and soil temperatures will be near 30 degrees C, (3) use large seeds at least 1 year old, (4) saturate the planting site just prior to planting, (5) cover seeds with about 13 mm of mulch to keep them moist and dark, and (6) if storms at planting site do not deposit at least 6 mm of rain within the first 5 days, rewater to bring the soil to saturation. If properly manages, alkali sacaton provides valuable forage and can effectively lower sediment losses. Management steps, outlined above, are based on results that show maximum conditions for survival, taking advantage of summer precipitation when seeds are mature, and the ability of seeds to emerge through as much as 4 cm of sediment deposited during runoff from sudden summer thunderstorms.
